## PREFACE.

—♦—

IN the February number, 1879, of a well-known German scientific journal, 'Kosmos,' Dr. Ernst Krause published a sketch of the life of Erasmus Darwin, the author of the 'Zoonomia,' 'Botanic Garden,' and other works. This article bears the title of a 'Contribution to the history of the Descent-Theory;' and Dr. Krause has kindly allowed my brother Erasmus and myself to have a translation made of it for publication in this country.\*

As I have private materials for adding to the knowledge of Erasmus Darwin's character, I have written a preliminary notice. These materials consist of a large collection of letters written by him; of his commonplace book in

\* Mr. Dallas has undertaken the translation, and his scientific reputation, together with his knowledge of German, is a guarantee for its accuracy.

folio, in the possession of his grandson Reginald Darwin; of some notes made shortly after his death, by my father, Dr. Robert Darwin, together with what little I can clearly remember that my father said about him; also some statements by his daughter, Violetta Darwin, afterwards Mrs. Tertius Galton, written down at the time by her daughters; and various short published notices. To these must be added the 'Memoirs of the Life of Dr. Darwin,' by Miss Seward, which appeared in 1804; and a lecture by Dr. Dowson on "Erasmus Darwin, Philosopher, Poet, and Physician," published in 1861, which contains many useful references and remarks.\*

\* Since the publication of Dr. Krause's article, Mr. Butler's work, 'Evolution, Old and New, 1879,' has appeared, and this includes an account of Dr. Darwin's life, compiled from the two books just mentioned, and of his views on Evolution.

[*First Edition, Nov. 1879.*]

[Mr. Darwin accidentally omitted to mention that Dr. Krause revised, and made certain additions to, his Essay before it was translated. Among these additions is an allusion to Mr. Butler's book, 'Evolution, Old and New.']

## NOTICE TO THE SECOND EDITION.

THE present differs in no important respect from the first edition. The title-page has been altered, a footnote has been added to the preface, and a table of contents to the biographical part of the book has been appended. A few points require correction.

Since the publication of the first edition some further knowledge of the Darwin family has been gained through the researches of the American genealogist Colonel Chester.\* Mr. Darwin's papers show that he intended to erase the first five lines on page 1 and replace them by the following passage:—

“Erasmus Darwin was descended from a family of yeomen who lived for several generations on their own land, apparently of con-

\* Further researches in the same subject are now being made by Mr. H. F. Burke, Somerset Herald. The results will appear in a forthcoming part of Dr. Howard's *Miscellanea Genealogica*.

siderable extent, at Marton in Lincolnshire. The great-grandson of the first Darwin of whom we know anything, seems to have been a loyal man, for in his will made in 1584 he bequeathed 3s. 4d. 'towards the setting up of the Queene's Majesties armes over the quearie (choir) door in the parishe Church of Marton.' His son William, born about 1575, possessed a small estate at Cleatham, at no great distance from Marton. He considered himself a gentleman, bore arms and married a lady." It was this William who served James I. as told in the 1st Edition.

P. 2. Erasmus Earle (from whom Erasmus Darwin probably derived his Christian name) should have been described as of Heydon Hall in Norfolk, and as representing Norwich in the Long Parliament.

The allusion to William Alvey Darwin (p. 5.) is misleading: it should have added that he was the ancestor of the elder branch of the family, the present possessors of Elston Hall.

At p. 85 it is said that Dr. R. W. Darwin received no pecuniary assistance beyond £20 from his father and a like sum from his uncle.

It appears however from papers in the possession of Mr. Reginald Darwin that he got £1000 under his mother's settlement, and £400 from his aunt Susannah Darwin.

At p. 106 some account is given of Erasmus Darwin's contributions to medicine. To these an interesting addition may now be made on the authority of Dr. Norman Moore. It appears that some progress towards the discovery of the relation of albuminuria to dropsy had been made before the time of Bright. Van Helmont and Cotunnus knew something of the matter, and Erasmus Darwin in quoting Cotunnus adds his own observations on "mucilaginous diabetes" in a case of what was clearly anasarca due to renal disease. These observations are mentioned as being of importance by Dr. John Blackall, who in 1795 observed in the wards of St. Bartholomew's Hospital a case of dropsy associated with albuminuria, and who showed in 1813 that in a certain type of dropsy, albuminuria is present. Finally about 1827 Bright showed how renal disease was the cause of albuminuria, and thus completed a valuable advance in medical knowledge. Erasmus Darwin's share in the

evolution of our knowledge on this subject was not large, but it seems that he was on the verge of showing that his "mucilaginous diabetes" was what is now known as albuminuria.

The epitaph in Breadsall Church is given at p. 127. A similar inscription has been recently placed in Lichfield Cathedral.

ERASMUS DARWIN, M.D., F.R.S.

Physician, Philosopher, and Poet,

Author of the 'Zoonomia,' 'Botanic Garden,' and other works.

A skilful observer of Nature,

Vivid in imagination, indefatigable in research,

Original and far-sighted in his views.

His speculations were mainly directed to problems

Which were afterwards more successfully solved by his

Grandson

CHARLES DARWIN,

An inheritor of many of his characteristics.

He was born A.D. 1731. He resided in the city of Lichfield from A.D. 1756 to A.D. 1781. He died A.D. 1802, and was buried at Breadsall, Derbyshire.

His first wife MARY, daughter of CHARLES HOWARD, lies buried in the Close.

These lines are inscribed beneath a bust erected in memory of Erasmus Darwin by his grandson Mr. Francis Galton.

F. D.

October, 1887.

## TABLE OF CONTENTS OF THE BIOGRAPHICAL PART.

Erasmus Darwin's ancestry, 1— Introduction of the name Erasmus into the family, 2 — Erasmus Darwin's grandmother inherited Elston Hall, 2 — His father Robert, "a person of curiosity," lived at Elston, 4 — His brother Robert a botanical author, 5 — Erasmus the fourth son born at Elston Hall, 12th December, 1731, 5 — His elder brother Robert's account of his youth, 6 — Goes to school at Chesterfield in 1741, 6 — Correspondence with his sister Susannah, 7, 9 — Her diary, 7 — Goes to Cambridge together with his two elder brothers in 1750, 11 — Takes the Exeter scholarship at St. John's College, 12 — In 1754 goes to Edinburgh to study medicine, 12 — Mr. Keir's account of him while at Edinburgh, 13 — His letters to Dr. Okes, 14 — Returns to Cambridge in 1755 and takes the degree of Bachelor of Medicine, 16 — Settles as a physician in Nottingham, Sep. 1756, 16 — Correspondence with Reimarus, 16 — Shorthand, 16 — Leaves Nottingham and settles in Lichfield, November 1756, 19 — Marries Mary Howard, Dec. 1757, 20 — She died in 1770, 20 — Letter to Mary Howard, 21 — Account of his profits from 1756 to 1773, 25 — Marries, 1781, the widow of Col. Chandos Pole of Radburn Hall, 26 — Removes to Derby and settles at Breadsall Priory, 27 — Acquaintance with Rousseau when at Wootton Hall, 27 — Letter on infanticide, 28 — Long-continued friendship with Keir, Day, Small, Boulton, Watt, and Josiah Wedgwood, 29 — Letters to Josiah Wedgwood,

30 — His character according to Mr. Keir, 35 — Letters to his son, Dr. Robert Waring Darwin, 37 — R. W. Darwin's account of his father, 40 — Dr. Johnson and Erasmus Darwin; their mutual dislike, 41 — His religious and political opinions, 43 — Detestation of slavery, 46 — On the side of the American colonies, 45 — Sympathy with Howard, 47 — Mr. Keir's account of his character, 49 — Letter to his son Robert, 1792, 50 — His opinion on the risks of retirement from professional life, 51 — Manner of travelling, 52 — Dr. Robert Darwin's notes on his father's character, &c., 53 — In 1784 the town of Derby had no Infirmary, 54 — Erasmus Darwin draws up a circular proposing a free dispensary for the sick poor, 54 — In the same year he takes chief part in founding a Philosophical Society in Derby, 55 — Persistently inculcates the evil effects of intemperance, 56 — Note on the oldest temperance societies, 57 — For many years never touched alcohol, 57 — Miss Seward's story of his swimming ashore from a boat when half intoxicated, and then haranguing the crowd from a tub, 58 — Visited by Mr. Edgeworth who gives an instance of his humanity, 60 — Miss Seward's testimony as to his charity and kindness to the poor, 62 — Gratitude of a Newmarket jockey, and of a highway robber, 63, 64 — His value of riches, 65 — Letter from Mr. Edgeworth on the subject, 67 — Portrait of him by Wright of Derby, 68 — Freedom from vanity, 69 — George III. suggests that he should move to London and to become his physician, 69 — Prefers a country life, 69 — His irascibility, 70 — Miss Seward's life of Erasmus Darwin, 70 — Its inaccuracies and false statements, 71 — Suicide of his son Erasmus — Explanation of Miss Seward's bitterness, 79 — Mrs. Schimmelpenninck's 'Life,' 79 — Account of his children, 80 — Charles born, 1758, died 1778, a young man of extraordinary promise in medicine and science, 80 — Erasmus born, 1759, died 1799: of peculiar tastes, 83 — Robert Waring born, 1766 (father of Charles Robert Darwin) died 1848, 84, 87 — His character and abilities, 85 — The children of the second

family: eldest daughter Violetta, mother of Francis Galton, 87: Sir Francis, physician and traveller, 87 — His commonplace book, 88 — His botanic garden at Lichfield, 1778, 89 — Hence the poems 'The Botanic Garden,' and 'Loves of the Plants,' published 1788, 90 — Mr. Edgeworth to Sir Walter Scott on a supposed plagiarism, 91 — Letters from Horace Walpole and Mr. Edgeworth on his poetry, 92, 94 — Cowper's and Hayley's poem in his honour, 95 — 'The Loves of the Triangles,' 96 — First scientific publication in the *Philosoph. Transactions*, 1757, 97 — Letters to Josiah Wedgwood on scientific matters, 1784, 98 — 'Zoonomia' published, 1794, 102 — Various subjects discussed in it; his anticipation of modern views, 105 — Medical practice and treatment of the insane influenced by his writings, 106 — Dr. Maudsley and Dr. Lauder Brunton on his views, 108, 109 — He recognises the principle of inheritance in disease, 110 — Prophetic sagacity as to "Microscopic Animals," 110 — The 'Phytologia' published in 1800, 111 — The view that a plant consists of a system of individuals originated with him, 111 — Treats of horticulture and agriculture, 112 — Fertilising properties of bone-dust first theoretically explained by him, 113 — Forecasts of modern thought, 113 — Struggle for life, 113 — A plan for the conduct of female education in boarding schools published in 1797, 115 — Much in advance of his age in sanitary matters, 117 — His interest in mechanical invention, 118 — His various inventions and machines, 119 — A speaking head for Matthew Boulton, 121 — Artesian wells, 122 — Meteorology, 124 — Erasmus Darwin died at Breadsall Priory on April 18th, 1802, 124 — Buried in Breadsall Church, 127 — Ernst Krause on the scientific works of Erasmus Darwin, 131.

## ERASMUS DARWIN.

ERASMUS DARWIN was descended from a Lincolnshire family, and the first of his ancestors of whom we know anything was William Darwin, who possessed a small estate at Cleatham.\* He was also yeoman of the armoury of Greenwich to James I. and Charles I. This office was probably almost a sinecure, and certainly of very small value. He died in 1644, and we have reason to believe from gout. It is therefore probable that Erasmus, as well as many other members of the family, inherited from this William, or some of his predecessors, their strong tendency to gout; and it was an early attack of gout which made Erasmus a vehement advocate for temperance throughout his whole life.

\* The greater part of the estate of Cleatham was sold in 1760. A cottage with thick walls, some fish-ponds and old trees, alone show where the "Old Hall" once stood. A field is still called the "Darwin Charity," from being subject to a charge, made by a later Mrs. Darwin, for buying gowns for four old widows every year.

The second William Darwin (born 1620) served as Captain-Lieutenant in Sir W. Pelham's troop of horse, and fought for the king. His estate was sequestrated by the Parliament, but he was afterwards pardoned on payment of a heavy fine. In a petition to Charles II. he speaks of his almost utter ruin from having adhered to the royal cause, and it appears that he had become a barrister. This circumstance probably led to his marrying the daughter of Erasmus Earle, Serjeant-at-law; and hence Erasmus Darwin derived his Christian name.

The eldest son from this marriage, William (born 1655), married the heiress of Robert Waring, of Wilsford, in the county of Nottingham. This lady also inherited the manor of Elston, which has remained ever since in the family.

This third William Darwin had two sons—William, and Robert who was educated as a barrister, and who was the father of Erasmus. I suppose that the Cleatham and the Waring properties were left to William, who seems to have followed no profession, and the Elston estate to Robert; for when

Elston Hall (where Erasmus Darwin was born), as it existed before 1754.

the latter married, he gave up his profession and lived ever afterwards at Elston. There is a portrait of him at Elston Hall, and he looks, with his great wig and bands, like a dignified doctor of divinity. He seems to have had some taste for science, for he was an early member of the well-known Spalding Club; and the celebrated antiquary, Dr. Stukeley, in 'An account of the almost entire Sceleton of a large animal,' &c., published in the 'Philosophical Transactions,' April and May 1719, begins his paper as follows:—"Having an account  
 "from my friend, Robert Darwin, Esq., of  
 "Lincoln's Inn, a Person of Curiosity, of a  
 "human Sceleton impressed in Stone, found  
 "lately by the Rector of Elston," &c. Stukeley then speaks of it as a great rarity, "the like  
 "whereof has not been observed before in this  
 "island, to my knowledge." Judging from a sort of litany written by Robert, and handed down in the family, he was a strong advocate of temperance, which his son ever afterwards so strongly advocated:—

From a morning that doth shine,  
 From a boy that drinketh wine,  
 From a wife that talketh Latine,  
 Good Lord deliver me.

It is suspected that the third line may be accounted for by his wife, the mother of Erasmus, having been a very learned lady.

The eldest son of Robert, christened Robert Waring, succeeded to the estate of Elston, and died there at the age of ninety-two, a bachelor. He had a strong taste for poetry, like his youngest brother Erasmus. Robert also cultivated botany, and when an oldish man, he published his 'Principia Botanica.' This book in MS. was beautifully written, and my father declared that he believed it was published because his old uncle could not endure that such fine calligraphy should be wasted. But this was hardly just, as the work contains many curious notes on biology—a subject wholly neglected in England in the last century. The public, moreover, appreciated the book, as the copy in my possession is the third edition.

Of the second son, William Alvey, I know nothing. A third son, John, became the rector of Elston, the living being in the gift of the family. The fourth son, and the youngest of the children, was Erasmus, the subject of the present memoir, who was born on the 12th Dec. 1731, at Elston Hall.

His elder brother, Robert, states, in a letter to my father (May 19, 1802), that Erasmus "was always fond of poetry. He was also "always fond of mechanicks. I remember "him when very young making an ingenious "alarum for his watch (clock?); he used also "to show little experiments in electricity "with a rude apparatus he then invented "with a bottle." The same tastes, therefore, appeared very early in life which prevailed to the day of his death. "He had always a "dislike to much exercise and rural diversions, and it was with great difficulty that "we could ever persuade him to accompany "us."

When ten years old (1741), he was sent to Chesterfield School, where he remained for nine years. His sister, Susannah, wrote to him at school in 1748, and I give part of the letter as a curiosity. She was then a young lady between eighteen and nineteen years old. She died unmarried, and her nephew, Dr. Robert Darwin (my father), who was deeply attached to her, always spoke of her as the very pattern of an old lady, so nice looking, so gentle, kind, and charitable, and passionately fond of flowers. The first part

of her letter consists of gossip and family news, and is not worth giving.

SUSANNAH DARWIN to ERASMUS.

DEAR BROTHER,

I come now to y<sup>e</sup> chief design of my Letter, and that is to acquaint you with my Abstinence this Lent, which you will find on y<sup>e</sup> other side, it being a strict account of y<sup>e</sup> first 5 days, and all y<sup>e</sup> rest has been conformable thereto; I shall be glad to hear from you w<sup>th</sup> an account of your temperance this lent, w<sup>ch</sup> I expect far exceeds mine. As soon as we kill our hog I intend to take part thereof with y<sup>e</sup> Family, for I'm informed by a learned Divine y<sup>t</sup> Hogs Flesh is Fish, and has been so ever since y<sup>e</sup> Devil entered into y<sup>m</sup> and they ran into y<sup>e</sup> Sea; if you and the rest of the Casuists in your neighbourhood are of y<sup>e</sup> same oppinion, it will be a greater satisfaction to me, in resolving so knotty a point of Conscience. This being all at present I conclude with all our dues to you and Bro<sup>r</sup>.

Your affectionate sister,  
S. DARWIN.

#### A DIARY IN LENT.

ELSTON, Feb. 20, 1748.

Feb<sup>ry</sup> 8 Wednesday Morning a little before seven I got up; said my Prayers; worked till eight;

y<sup>n</sup> took a walk, came in again and eate a farthing Loaf, y<sup>n</sup> dress'd me, red a Chapter in y<sup>e</sup> Bible, and spun till One, y<sup>n</sup> dined temperately viz: on Puddin, Bread and Cheese; spun again till Fore, took a walk, y<sup>n</sup> spun till half an hour past Five; eat an Apple, Chattered round y<sup>e</sup> Fire; and at Seven a little boyl'd Milk; and y<sup>n</sup> (takeing my leave of Cards y<sup>e</sup> night before) spun till nine; drank a Glass of Wine for y<sup>e</sup> Stomack sake; and at Ten retired into my Chamber to Prayers; drew up my Clock and set my Larum betwixt Six and Seven.

Thursday call'd up to Prayers, by my Larum; spun till Eight, collected y<sup>e</sup> Hens' Eggs; breakfasted on Oat Cake, and Balm Tea; y<sup>n</sup> dress'd and spun till One, Pease Porrage, Pottatoes and Apple Pye; y<sup>n</sup> turned over a few pages in Scribelerus; eat an Apple and got to my work; at Seven got Apple Pye and Milk, half an hour after eight red in y<sup>e</sup> Tatlar and at Ten withdrew to Prayers; slept sound; rose before Seven; eat a Pear; breakfast a quarter past Eight; fed y<sup>e</sup> Cats, went to Church; at One Pease Porrage, Puddin, Bread and Cheese; Fore Mrs. Chappells came, Five drank Tea; Six eat half an Apple; Seven a Porrenge of Boyl'd Milk; red in y<sup>e</sup> Tatlar; at Eight a Glass of Punch; filled up ye vacancies of y<sup>e</sup> day with work as before.

Saturday Clock being too slow lay rather longar y<sup>n</sup> usal; said my Prayers; and breakfasted at Eight; at One broth, Pudding, Brocoli and Eggs, and

Apple Pye; at Five an Apple; seven Apple Pye, Bread and Butter; at Nine a Glass of Wine; at Ten Prayers.

Sunday breakfast at Eight; at Ten went to y<sup>e</sup> Chappell; 12 Dumplin, red Herring, Bread and Cheese; two to y<sup>e</sup> Church; read a Lent Sermon at Six; and at Seven Appel Pye Bread and Cheese.

Excuse hast, being very cold.

ERASMUS, ÆTAT. 16, to SUSANNAH DARWIN.

DEAR SISTER,

I receiv'd yours about a fortnight after y<sup>e</sup> date y<sup>t</sup> I must begg to be excused for not answering it sooner: besides I have some substantial Reasons, as having a mind to see Lent almost expired, before I would vouch for my Abstinence throughout y<sup>e</sup> whole: and not having had a convenient oppertunity to consult a Synod of my learned friends about your ingenious Conscience, and I must inform you we unanimously agree in y<sup>e</sup> Opinion of y<sup>e</sup> Learned Divine you mention, that Swine may indeed be fish but then they are a devillish sort of fish; and we can prove from y<sup>e</sup> same Authority that all fish is flesh whence we affirm Porck not only to be flesh but a devillish Sort of flesh; and I would advise you for Conscience sake altogether to abstain from tasting it; as I can assure You I have done, tho' roast Pork has come to Table several Times; and for my own part

have lived upon Puding, milk, and vegetables all this Lent; but don't mistake me, I don't mean I have not touch'd roast beef, mutton, veal, goose, fowl, &c. for what are all these? All flesh is grass! Was I to give you a journal of a Week, it would be stuff so full of Greek and Latin as translation Verses, themes, annotation Exercise and y<sup>e</sup> like, it would not only be very tedious and insipid but perfectly unintelligible to any but Scholboys.

I fancy you forgot in Yours to inform me y<sup>t</sup> your Cheek was quite settled by your Temperance, but however I can easily suppose it. For y<sup>e</sup> temperate enjoy an ever-blooming Health free from all y<sup>e</sup> Infections and disorders luxurious mortals are subject to, the whimsical Tribe of Phisitians cheated of their fees may sit down in penury and Want, they may curse mankind and imprecate the Gods and call down y<sup>t</sup> parent of all Deseases, luxury, to infest Mankind, luxury more destructive than y<sup>e</sup> Sharpest Famine; tho' all the Distempers that ever Satan inflicted upon Job hover over y<sup>e</sup> intemperate; they would play harmless round our Heads, nor dare to touch a single Hair. We should not meet those pale thin and haggard countenances which every day present themselves to us. No doubt men would still live their Hunderd, and Methusalem would lose his Character; fever banished from our Streets, limping Gout would fly y<sup>e</sup> land, and Sedentary Stone would vanish into oblivion and death himself be slain.

I could for ever rail against Luxury, and for ever panegyryze upon abstinence, had I not already encroach'd too far upon your Patience, but it being Lent the exercise of y<sup>t</sup> Christian virtue may not be amiss, so I shall proceed a little further—

[The remainder of the letter is hardly legible or intelligible, with no signature.]

P.S.—Excuse Hast, supper being called, very Hungry.

Judging from two letters—the first written in 1749, to one of the under-masters during the holidays, and the other to the head-master, shortly after he went to Cambridge, in 1750—he seems to have felt a degree of respect, gratitude, and affection for the several masters unusual in a schoolboy. Both these letters were accompanied by an inevitable copy of verses, those addressed to the head-master being of considerable length, and in imitation of the 5th Satire of Persius. His two elder brothers accompanied him to St. John's College, Cambridge; and this seems to have been a severe strain on their father's income. They appear, in consequence, to have been thrifty and honourably economi-

cal; so much so that they mended their own clothes; and, many years afterwards, Erasmus boasted to his second wife that, if she cut the heel out of a stocking, he would put a new one in without missing a stitch. He won the Exeter Scholarship at St. John's, which was worth only £16 per annum. No doubt he studied the classics whilst at Cambridge, for he did so to the end of his life, as shown by the many quotations in his latest work, 'The Temple of Nature.' He must also have studied mathematics to a certain extent, for, when he took his Bachelor of Arts degree, in 1754, he was at the head of the Junior Optimes. Nor did he neglect medicine; and he left Cambridge during one term to attend Hunter's lectures in London. As a matter of course, he wrote poetry whilst at Cambridge, and a poem on 'The Death of Prince Frederick,' in 1751, was published many years afterwards, in 1795, in the European Magazine.

In the autumn of 1754 he went to Edinburgh to study medicine, and while there, seems to have been as rigidly economical as at Cambridge; for amongst his papers there is a receipt for his board from July 13th to October

13th, amounting to only £6 12s. Mr. Keir, afterwards a distinguished chemist, was at Edinburgh with him, and after his death wrote to my father (May 12th, 1802): "The classical and literary attainments which he had acquired at Cambridge gave him, when he came to Edinburgh, together with his poetical talents and ready wit, a distinguished superiority among the students there. Every one of the above-mentioned Professors [whose lectures he attended], excepting Dr. Whytt, had been a pupil of the celebrated Boerhaave, whose doctrines were implicitly adopted. It would be curious to know (but he alone could have told us) the progress of your father's mind from the narrow Boerhaavian system, in which man was considered as an hydraulic machine whose pipes were filled with fluid susceptible of chemical fermentations, while the pipes themselves were liable to stoppages or obstructions (to which obstructions and fermentations all diseases were imputed), to the more enlarged consideration of man as a *living being*, which affects the phenomena of health and disease more than his merely

“mechanical and chemical properties. It is true that about the same time, Dr. Cullen and other physicians began to throw off the Boerhaavian yoke; but from the minute observation which Dr. Darwin has given of the laws of association, habits and phenomena of animal life, it is manifest that his system is the result of the operation of his own mind.”

The only other record of his life in Edinburgh which I possess is a letter to his friend Dr. Okes, of Exeter,\* written shortly after the death of his father (1754), when he was twenty-three years old. It shows his sceptical frame of mind whilst he was quite a young man.

ERASMUS DARWIN to DR. OKES.

“Yesterday’s post brought me the disagreeable news of my father’s departure out of this sinful world.

“He was a man of more sense than learning; of very great industry in the law, even after he had no business, nor expectation of any. He was frugal, but not covetous; very tender to his children, but

\* Published by one of his descendants in the ‘Gentleman’s Magazine,’ Oct. 1808, vol. lxxviii. pt. ii. p. 869.

still kept them at an awful kind of distance. He passed through this life with honesty and industry, and brought up seven healthy children to follow his example.

“He was 72 years old, and died the 20th of this current November 1754. ‘Blessed are they that die in the Lord.’

“That there exists a superior ENS ENTIVM, which formed these wonderful creatures, is a mathematical demonstration. That HE influences things by a particular providence, is not so evident. The probability, according to my notion, is against it, since general laws seem sufficient for that end. Shall we say no particular providence is necessary to roll this Planet round the Sun, and yet affirm it necessary in turning up *cinque* and *quatorze*, while shaking a box of dies? or giving each his daily bread? The light of Nature affords us not a single argument for a future state; this is the only one, that it is possible with God, since He who made us out of nothing can surely re-create us; and that He will do this is what we humbly hope. I like the Duke of Buckingham’s epitaph—‘Pro Rege sæpe, pro Republicâ semper, dubius, non improbus vixi; incertus, sed inturbatus morior. Christum advenero, Deo confido benevolenti et omnipotenti, Ens Entium miserere mei!’

“ERASMUS DARWIN.”

The expression “disagreeable news,” ap-

plied to his father's death, sounds very odd to our ears, but he evidently used this word where we should say "painful." For, in a feeling letter to Josiah Wedgwood, the famous potter, written a quarter of a century afterwards (Nov. 29th, 1780), about the death of their common friend Bentley, in which he alludes to the death of his own son, he says nothing but exertion will dispossess "the disagreeable ideas of our loss."

In 1755 he returned to Cambridge, and took his Bachelor of Medicine degree. He then again went to Edinburgh, and early in Sept. 1756, settled as a physician in Nottingham. Here, however, he remained for only two or three months, as he got no patients. Whilst in Nottingham he wrote several letters, some in Latin and some in English, to his friend, the son of the famous German philosopher, Reimarus.\* Mechanics and medicine were the bonds of union between them. Erasmus also dedicated a poem to young Reimarus, on his taking his degree at Leyden

\* I am much indebted to a son of Dr. Sieveking, who brought to England the original letters preserved by the descendants of Reimarus, for permitting me to have them photographed.

in 1754. Various subjects were discussed between them, including the wildest speculations by Erasmus on the resemblance between the action of the human soul and that of electricity, but the letters are not worth publishing. In one of them he says: "I believe I forgot to tell how Dr. Hill makes his 'Herbal' (a formerly well-known book). He has got some wooden plates from some old herbal, and the man that cleans them cuts out one branch of every one of them, or adds one branch or leaf, to disguise them. This I have from my friend Mr. G——y, watch-maker, to whom this printer told it, adding, 'I make plants now every day that God never dreamt of.'" It also appears from one of his letters to Reimarus, that Erasmus corresponded at this time about short-hand writing with Gurney, the author of a well-known book on this subject. Whilst still young he filled six volumes with short-hand notes, and continued to make use of the art for some time.

Several of the letters to Reimarus relate to a case in which Dr. Darwin appears to have been much interested. He sent or helped to

send a working man to a London surgeon, Mr. D., for a serious operation. Reimarus and Dr. Darwin appear to have had some misunderstanding with the surgeon, expecting that he would perform the operation gratuitously. Dr. Darwin writes to Reimarus: "I am very sorry to hear that D. took six guineas from the poor young man. He has nothing but what hard labour gives him; is much distressed by this thing costing him near £30 in all, since the house where he lay cheated him much. . . . When he returns I shall send him two guineas. I beg you would not mention to my brother that I send this to him." Why his brother should not be told of this act of charity it is difficult to conjecture. From two other letters it appears that Dr. Darwin wrote anonymously to his friend the surgeon, complaining of his charge; and that when suspected of this discreditable act he did not own the authorship of the letter. He wrote to Reimarus (Nottingham Sept. 9th, 1756): "You say I am suspected to be the Author of it (*i.e.* the anonymous letter), and next to me some malicious per-

"son somewhere else, and that I am desired as I am a gentleman to declare concerning it. First, then, as I am upon Honour, I must not conceal that I am glad there are Persons who will revenge Faults the Law can not take hold off: and I hope Mr. D. will not be affronted at this Declaration; since you say he did not know the Distress of the Man. Secondly, as another Person is suspected, I will not say whether I am the Author or not, since I don't think the Author merits Punishment, for informing Mr. D. of a Mistake. You call the Letter a threatening Letter, and afterwards say the Author pretends to be a Friend to Mr. D. This, though you give me several particulars of it, is a Contradiction I don't understand." In a P.S. he adds that Reimarus might show the letter to Mr. D. The anonymous letter answered its purpose, for the surgeon returned four guineas, and Dr. Darwin thought it probable that he would ultimately return the other two guineas.

In November 1756, Erasmus settled in Lichfield, and now his life may be said to

have begun in earnest; for it was here, and in or near Derby, to which place he removed in 1781, that he published all his works. Owing to two or three very successful cases, he soon got into some practice at Lichfield as a physician, when twenty-five years old. A year afterwards (Dec. 1757) he married Miss Mary Howard, aged 17-18 years, who, judging from all that I have heard of her, and from some of her letters, must have been a superior and charming woman. She died after a long and suffering illness in 1770. They seem to have lived together most happily during the thirteen years of their married life, and she was tenderly nursed by her husband during her last illness. Miss Seward gives,\* on second-hand authority, a long speech of hers, ending with the words, "he has prolonged my days, "and he has blessed them." This is probably true, but everything which Miss Seward says must be received with caution; and it is scarcely possible that a speech of such length could have been reported with any accuracy.

The following letter was written by

\* 'Memoirs of the Life of Dr. Darwin,' 1804, pp. 11-14.

Erasmus four days before his marriage with Miss Howard.

ERASMUS DARWIN to MARY HOWARD.

DEAR POLLY,

DARLASTON, Dec. 24, 1757.

As I was turning over some old mouldy volumes, that were laid upon a Shelf in a Closet of my Bed-chamber; one I found, after blowing the Dust from it with a Pair of Bellows, to be a Receipt Book, formerly, no doubt, belonging to some good old Lady of the Family. The Title Page (so much of it as the Rats had left) told us it was "a Bouk off verry monny muckle vallyed Receipts bouth in Kookery and Physicks." Upon one Page was "To make Pye-Crust,"—in another "To make Wall-Crust,"—"To make Tarts,"—and at length "To make Love." "This Receipt," says I, "must be curious, I'll send it to Miss Howard next Post, let the way of making it be what it will."—Thus it is "To make Love. Take of Sweet-William and of Rose-Mary, of each as much as is sufficient. To the former of these add of Honesty and Herb-of-grace; and to the latter of Eye-bright and Motherwort of each a large handful: mix them separately, and then, chopping them altogether, add one Plumb, two sprigs of Heart's Ease and a little Tyme. And it makes a most excellent dish, probatum est. Some put in Rue, and Cuckold-Pint, and Heart-Chokes,

and Coxcome, and Violents; But these spoil the flavour of it entirely, and I even disprove of Sallery which some good Cooks order to be mix'd with it. I have frequently seen it toss'd up with all these at the Tables of the Great, where no Body would eat of it, the very appearance was so disagreeable."

Then follow'd "Another Receipt to make Love," which began "Take two Sheep's Hearts, pierce them many times through with a Scewer to make them Tender, lay them upon a quick Fire, and then taking one Handful——" here Time with his long Teeth had gnattered away the remainder of this Leaf. At the Top of the next Page, begins "To make an honest Man." "This is no new dish to me," says I, "besides it is now quite old Fashioned; I won't read it." Then follow'd "To make a good Wife." "Pshaw," continued I, "an acquaintance of mine, a young Lady of Lichfield, knows how to make this Dish better than any other Person in the World, and she has promised to treat me with it sometime," and thus in a Pett threw down the Book, and would not read any more at that Time. If I should open it again tomorrow, whatever curious and useful receipts I shall meet with, my dear Polly may expect an account of them in another Letter.

I have the Pleasure of your last Letter, am glad to hear thy cold is gone, but do not see why it should keep you from the concert, because it was gone. We drink your Health every day here, by

the Name of Dulcinea del Toboso, and I told Mrs. Jervis and Miss Jervis that we were to have been married yesterday, about which they teased me all the Evening. I heard nothing of Miss Fletcher's Fever before. I will certainly be with Thee on Wednesday evening, the Writings are at my House, and may be dispatched that night, and if a License takes up any Time (for I know nothing at all about these Things) I should be glad if Mr. Howard would order one, and by this means, dear Polly, we may have the Ceremony over next morning at eight o'clock, before any Body in Lichfield can know almost of my being come Home. If a License is to be had the Day before, I could wish it may be put off till late in the Evening, as the Voice of Fame makes such quick Dispatch with any News in so small a Place as Lichfield.—I think this is much the best scheme, for to stay a few Days after my Return could serve no Purpose, it would only make us more watch'd and teased by the Eye and Tongue of Impertinence.—I shall by this Post apprize my Sister to be ready, and have the House clean, and I wish you would give her Instructions about any trivial affairs, that I cannot recollect, such as a cake you mentioned, and tell her the Person of whom, and the Time when it must be made, &c. I'll desire her to wait upon you for this Purpose. Perhaps Miss Nelly White need not know the precise Time till the Night before, but this as you please, as I (*illegible*). You could rely upon her Secrecy, and

it's a Trifle, if any Body should know. Matrimony, my dear Girl, is undoubtedly a serious affair, (if any Thing be such) because it is an affair for Life: But, as we have deliberately determin'd, do not let us be *frighted* about this Change of Life; or however, not let any breathing Creature perceive that we have either Fears or Pleasures upon this Occasion: as I am certainly convinced, that the best of Confidants (tho' experienced on a thousand other Occasions) could as easily hold a burning cinder in their Mouth as anything the least ridiculous about a new married couple! I have ordered the Writings to be sent to Mr. Howard that he may peruse and fill up the blanks at his Leizure, as it wilt (I foresee) be dark night before I get to Lichfield on Wednesday. Mrs. Jervis and Miss desire their Compl. to you, and o'ten say how glad she shall be to see you for a few Days at any Time. I shall be glad, Polly, if thou hast Time on Sunday night, if thou wilt favour me with a few Lines by the return of the Post, to tell me how Thou doest, &c.—My Compl. wait on Mr. Howard if He be returned.—My Sister will wait upon you, and I hope, Polly, Thou wilt make no Scruple of giving her Orders about whatever you chuse, or think necessary. I told her Nelly White is to be Bride-Maid. Happiness attend Thee! adieu  
from, my dear Girl,

thy sincere Friend,

E. DARWIN.

P.S.—Nothing about death in this Letter, Polly.

It has been said that he soon got into practice at Lichfield, and I have found the following memorandum of his profits in his own handwriting:—

*The profits of my business amounted*

			£	s.	d.
From Nov. 12, 1756 to Jan. 1, 1757			18	7	6
Jan. 1757	„	1758	192	10	6
„ 1758	„	1759	305	2	0
„ 1759	„	1760	469	4	0
„ 1760	„	1761	544	2	0
„ 1761	„	1762	669	18	0
„ 1762	„	1763	726	0	0
From Jan. 12, 1763 to Jan. 1, 1764			639	13	0
„ 1764	„	1765	750	13	0

„ 1771	„	1772	1064	7	6
„ 1772	„	1773	1025	3	0

Later in life he gave up the good habit of keeping accurate accounts, for in 1799 he wrote to my father that he had been much perplexed what return to make to the commissioners (of income tax?), as “I kept no book, but believed my business to be £1000 a year, and de-

“ duct £200 for travelling expenses and chaise  
 “ hire, and £200 for a livery-servant, four  
 “ horses and a day labourer.” Subsequently  
 he informed my father that the commissioners  
 had accepted this estimate. A century ago  
 an income of £1000 would probably be equal  
 to one of £2000 at the present time; but I am  
 greatly surprised that his profits were not  
 larger. All his friends constantly refer to  
 his long and frequent journeys, for his prac-  
 tice lay chiefly amongst the upper classes  
 of society. When he went to live at the  
 Priory, he remarked to my father in a letter  
 that five or six additional miles would make  
 little difference in the fatigue of his journeys.

In 1781, eleven years after the death of  
 his first wife, he married the widow of  
 Colonel Chandos Pole, of Radburn Hall. He  
 had become acquainted with her in the  
 Spring of 1778, when she had come to  
 Lichfield in order that he might attend her  
 children professionally. It is evident from  
 the many MS. verses addressed to her before  
 their marriage, that Dr. Darwin was passion-  
 ately attached to her, even during the life-  
 time of her husband, who died in 1780.

These verses are somewhat less artificial than  
 his published ones. On his second marriage  
 he left Lichfield, and after living two years  
 at Radburn Hall, he removed into the town  
 of Derby, and ultimately to Breadsall Priory,  
 a few miles from the town, where he died  
 in 1802.

There is little to relate about his life at  
 either Lichfield or Derby, and, as I am not  
 attempting a connected narrative, I will here  
 give such impressions as I have formed of his  
 intellect and character, and a few of his letters  
 which are either interesting in themselves, or  
 which throw light upon what he thought and  
 felt.

His correspondence with many distin-  
 guished men was large; but most of the  
 letters which I possess or have seen are unin-  
 teresting, and not worth publication. Medi-  
 cine and mechanics alone roused him to  
 write with any interest. He occasionally  
 corresponded with Rousseau, with whom he  
 became acquainted in an odd manner, but  
 none of their letters have been preserved.  
 Rousseau was living in 1766 at Mr. Daven-  
 port's house, Wootton Hall, and used to

spend much of his time "in the well-known  
"cave upon the terrace in melancholy con-  
"templation." He disliked being interrupted,  
so Dr. Darwin, who was then a stranger to  
him, sauntered by the cave, and minutely  
examined a plant growing in front of it. This  
drew forth Rousseau, who was interested in  
botany, and they conversed together, and  
afterwards corresponded during several years.

I find a letter written in February 1767 on  
a singular subject. A gentleman had con-  
sulted him about the body of an infant which  
had apparently been murdered. It was  
believed to be the illegitimate child of a  
lady, and to have been murdered by its  
mother. He kept a copy of this letter,  
without any address. Omitting all medical  
details it runs as follows:—

DEAR SIR,

LICHFIELD, *Feb. 7, 1767.*

I am sorry you should think it necessary to  
make any excuse for a Letter I this morning received  
from you. The Cause of Humanity needs no Apology  
to me.

\* \* \* \* \*

The Women that have committed this most  
unnatural crime, are real objects of our greatest

Pity; their education has produced in them so  
much Modesty, or sense of Shame, that this artificial  
Passion overturns the very instincts of Nature!—  
what Struggles must there be in their minds, what  
agonies!—at a Time when, after the Pains of Par-  
turation, Nature has designed them the sweet Conso-  
lation of giving Suck to a little helpless Babe, that  
depends on them for its hourly existence!—Hence  
the cause of this most horrid crime is an excess of  
what is really a Virtue, of the Sense of Shame, or  
Modesty. Such is the Condition of human Nature!  
I have carefully avoided the use of scientific terms  
in this Letter that you may make any use of it you  
may think proper; and shall only add that I am  
veryly convinced of the Truth of every part of it.

and am, Dear Sir,

Your affectionate friend and servant,

ERASMUS DARWIN.

There is, perhaps, no safer test of a man's  
real character than that of his long continued  
friendship with good and able men. Now,  
Mr. Edgeworth, the father of Maria Edge-  
worth, the authoress, asserts,\* after mention-  
ing the names of Keir, Day, Small, Bolton,  
Watt, Wedgwood, and Darwin, that "their  
"mutual intimacy has never been broken

\* 'Memoirs of R. L. Edgeworth,' 2nd ed. vol. i. p. 181.

“except by death.” To these names, those of Edgeworth himself and of the Galtons may be added. The correspondence in my possession shows the truth of the above assertion. Mr. Day was a most eccentric character, whose life has been sketched by Miss Seward: he named Erasmus Darwin “as one of the three friends from whom he “had met with constant kindness;”\* and Dr. Darwin, in a letter to my father, says: “I much lament the death of Mr. Day. “The loss of one’s friends is one great evil “of growing old. He was dear to me by “many names (*multis mihi nominibus charus*), “as friend, philosopher, scholar, and honest “man.”

I give below two of his letters to Josiah Wedgwood.

ERASMUS DARWIN to JOSIAH WEDGWOOD.

DEAR WEDGWOOD, LICHFIELD, *Sept.* 30, 1772.

I did not return soon enough out of Derbyshire to answer your letter by yesterday’s Post. Your second letter gave me great consolation about Mrs. Wedgwood, but gave me most sincere grief

\* ‘Memoirs of R. L. Edgeworth,’ 2nd ed. vol. ii. p. 113.

about Mr. Brindley, whom I have always esteemed to be a great genius, and whose loss is truly a public one. I don’t believe he has left his equal. I think the various Navigations should erect him a monument in Westminster Abbey, and hope you will at the proper time give them this hint.

Mr. Stanier sent me no account of him, except of his death, though I so much desired it, since if I had understood that he got worse, nothing should have hindered me from seeing him again. If Mr. Henshaw took any Journal of his illness or other circumstances after I saw him, *I wish you would ask him for it and enclose it to me.* And any circumstances that you recollect of his life should be wrote down, and I will some time digest them into an Eulogium. These men should not die, this Nature denies, but their Memories are above her Malice. Enough!

\* \* \* \* \*

ERASMUS DARWIN to JOSIAH WEDGWOOD.

DEAR SIR,

LICHFIELD, *Nov.* 29, 1780.

Your letter communicating to me the death of your friend, and I beg I may call him mine Mr. Bentley, gives me very great concern; and a train of very melancholy ideas succeeds in my mind, unconnected indeed with your loss, but which still at times casts a shadow over me, which nothing but exertion in business or in acquiring knowledge can remove.

This exertion I must recommend to you, as it for a time dispossesses the disagreeable ideas of our loss; and gradually their impression or effect upon us becomes thus weakened, till the traces are scarcely perceptible, and a scar only is left, which reminds us of the past pain of the united wound.

Mr. Bentley was possessed of such variety of knowledge, that his loss is a public calamity, as well as to his friends, though they must feel it the most sensibly! Pray pass a day or two with me at Lichfield, if you can spare the time, at your return. I want much to see you; and was truly sorry I was from home as you went up; but I do beg you will always lodge at my house on your road, as I do at yours, whether you meet with me at home or not.

I have searched in vain in Melmoth's translation of Cicero's letters for the famous consolatory letter of Sulpicius to Cicero on the loss of his daughter (as the work has no index), but have found it, the first letter in a small publication called 'Letters on the most common as well as important occasions in Life:' Newberry, St. Paul's, 1758. This letter is a masterly piece of oratory indeed, adapted to the man, the time, and the occasion. I think it contains everything which could be said upon the subject, and if you have not seen it I beg you to send for the book.

For my own part, too sensible of the misfortunes of others for my own happiness, and too pertinacious of the remembrance of my own [*i.e.* the death of his

son Charles in 1778], I am rather in a situation to demand than to administer consolation. Adieu. God bless you, and believe me, dear Sir, your affectionate friend

E. DARWIN.

Ten years later he seems to have doubted much about the consolation to be derived from the letter of Sulpicius, for he writes (1790) to Edgeworth:\*

I much condole with you on your late loss. I know how to feel for your misfortune. The little Tale you sent is a prodigy, written by so young a person, with such elegance of imagination. *Nil admirari* may be a means to escape misery, but not to procure happiness. There is not much to be had in this world—we expect too much! I have had my loss also. The letter of Sulpicius to Cicero is fine eloquence, but comes not to the heart; it tugs, but does not draw the arrow. Pains and diseases of the mind are only cured by Time. Reason but skins the wound, which is perpetually liable to fester again.

Amongst the old letters preserved, there is one without any date from Hutton, the founder of the modern science of geology, and I extract its commencement, as proceeding from so illustrious a scientific man. Dr.

\* 'Memoirs,' 2nd ed. 1821, vol. ii. p. 110.

Darwin seems to have complained to him of having been cheated by some publisher; and Hutton answers:—

If you have no more money than you use, then be as sparing of it as you please, but if you have money to spend, then pray learn to let yourself be cheated, that is, learn to lay out money for which you have no other use. If this be not philosophy, at least it is good sense; for why the devil should a man have money to be a plague to him, when it is so easy to throw it away; and if thro' a spirit of general benevolence you are afraid of mankind suffering from this root of all evil, for God's sake send it to the bottom of the sea, it there can only poison fish and it will there make in time a noble fossil specimen.

One of his granddaughters has remarked to me, that the term "benevolent" has been associated with his name, almost in the same manner as that of "judicious" with the name of the old divine, Hooker. This is perfectly true, for I have incessantly met with this expression in letters and in the many published notices about him. To the word benevolent, sympathy is generally added, and often generosity, as well as hospitality. Mr. Edgeworth says: \* "I have known him intimately

\* 'Monthly Magazine' 1802 p. 115.

" during thirty-six years, and in that period  
" have witnessed innumerable instances of his  
" benevolence."

His life-long friend, Mr. Keir, wrote to my father (May 12th, 1802) about his character as follows: "I think all those who knew  
" him, will allow that sympathy and be-  
" nevolence were the most striking features.  
" He felt very sensibly for others, and, from  
" his knowledge of human nature, he entered  
" into their feelings and sufferings in the  
" different circumstances of their constitution,  
" character, health, sickness, and prejudice.  
" In benevolence, he thought that almost all  
" virtue consisted. He despised the monkish  
" abstinences and the hypocritical pretensions  
" which so often impose on the world. The  
" communication of happiness and the relief  
" of misery were by him held as the only  
" standard of moral merit. Though he ex-  
" tended his humanity to every sentient  
" being, it was not like that of some philo-  
" sophers, so diffused as to be of no effect;  
" but his affection was there warmest where  
" it could be of most service to his family  
" and his friends, who will long remember

“the constancy of his attachment and his zeal for their welfare.” His neighbour, Sir Brooke Boothby, after the loss of his child (to whom the beautiful and well-known monument in Ashbourne church was erected), in an ode addressed to Dr. Darwin, writes in strong terms about his sympathy and power of consolation.

But it is fair to state that from my father's conversation, I infer that Dr. Darwin had acted towards him in his youth rather harshly and imperiously, and not always justly; and though in after years he felt the greatest interest in his son's success, and frequently wrote to him with affection, in my opinion the early impression on my father's mind was never quite obliterated.

I have heard indirectly (through one of his stepsons) that he was not always kind to his son Erasmus, being often vexed at his retiring nature, and at his not more fully displaying his great talents. On the other hand his children by his second marriage seem to have entertained the warmest affection for him.

ERASMUS DARWIN *to* HIS SON ROBERT.

DEAR ROBERT,

*April 19, 1789.*

I am sorry to hear you say you have many enemies, and one enemy often does much harm. The best way, when any little slander is told one, is never to make any piquant or angry answer; as the person who tells you what another says against you, always tells them in return what you say of them. I used to make it a rule always to receive all such information very coolly, and never to say anything biting against them which could go back again; and by these means many who were once adverse to me, in time became friendly. Dr. Small always went and drank tea with those who he heard had spoken against him; and it is best to show a little attention at public assemblies to those who dislike one; and it generally conciliates them.

\* \* \* \* \*

Robert seems to have consulted his father about some young man, whom he wished to see well started as an apothecary, and received the following answer:—

ERASMUS DARWIN *to* HIS SON ROBERT.

DEAR ROBERT,

*DERBY, Dec. 17, 1790.*

I cannot give any letters of recommendation to Lichfield, as I am and have been from their in-

fancy acquainted with all the apothecaries there; and as such letters must be directed to some of their patients, they would both feel and resent it. When Mr. Mellor went to settle there from Derby I took no part about him. As to the prospect of success there, if the young man who is now at Edinburgh should take a degree (which I suppose is probable), he had better not settle in Lichfield.

I should advise your friend to use at first all means to get acquainted with the people of all ranks. At first a parcel of blue and red glasses at the windows might gain part of the retail business on market days, and thus get acquaintance with that class of people. I remember Mr. Green, of Lichfield, who is now growing very old, once told me his retail business, by means of his show-shop and many-coloured window, produced him £100 a year. Secondly, I remember a very foolish, garrulous apothecary at Cannock, who had great business without any knowledge or even art, except that he persuaded people he kept good drugs; and this he accomplished by only one stratagem, and that was by *boring* every person who was so unfortunate as to step into his shop with the goodness of his drugs. "Here's a fine piece of assafœtida, smell of this valerian, taste this album græcum. Dr. Fungus says he never saw such a fine piece in his life." Thirdly, dining every market day at a farmers' ordinary would bring him some acquaintance, and I don't think a little impedi-

ment in his speech would at all injure him, but rather the contrary by attracting notice. Fourthly, card assemblies,—I think at Lichfield surgeons are not admitted as they are here;—but they are to dancing assemblies; these therefore he should attend. Thus have I emptied my quiver of the *arts* of the Pharmacopol. Dr. K——d, I think, supported his business by perpetual boasting, like a Charlatan; this does for a blackguard character, but ill suits a more polished or modest man.

If the young man has any friends at Shrewsbury who could give him letters of introduction to the proctors, this would forward his getting acquaintance. For all the above purposes some money must at first be necessary, as he should appear well; which money cannot be better laid out, as it will pay the greatest of all interest by settling him well for life. Journeymen Apothecaries have not greater wages than many servants; and in this state they not only lose time, but are in a manner lowered in the estimation of the world, and less likely to succeed afterwards. I will certainly send to him, when first I go to Lichfield. I do not think his impediment of speech will injure him; I did not find it so in respect to myself. If he is not in such narrow circumstances but that he can appear well, and has the knowledge and sense you believe him to have, I dare say he will succeed anywhere. A letter of introduction from you to Miss Seward, men-

tioning his education, may be of service to him, and another from Mr. Howard. Adieu, from, dear Robert,

Yours most affectionately,

E. DARWIN.

My father spoke of Dr. Darwin as having great powers of conversation. Lady Charleville, who had been accustomed to the most brilliant society in London, told him that Dr. Darwin was one of the most agreeable men whom she had ever met. He himself used to say "there were two sorts of agreeable persons in conversation parties—agreeable talkers and agreeable listeners."

He stammered greatly, and it is surprising that this defect did not spoil his powers of conversation. A young man once asked him in, as he thought, an offensive manner, whether he did not find stammering very inconvenient. He answered, "No, Sir, it gives me time for reflection, and saves me from asking impertinent questions." Miss Seward speaks of him as being extremely sarcastic, but of this I can find no evidence in his letters or elsewhere. It is a pity that Dr. Johnson in his visits to Lichfield rarely

met Dr. Darwin; but they seem to have disliked each other cordially, and to have felt that if they met they would have quarrelled like two dogs. There can, I suppose, be little doubt that Johnson would have come off victorious. In a volume of MSS. by Dr. Darwin, in the possession of one of his granddaughters, there is the following stanza:

From Lichfield famed two giant critics come,  
Tremble, ye Poets! hear them! "Fe, Fo, Fum!"  
By Seward's arm the mangled Beaumont bled,  
And Johnson grinds poor Shakespear's bones for bread.

He is evidently alluding to Mr. Seward's edition of 'Beaumont and Fletcher's Plays,' and to Johnson's edition of 'Shakespear' in 1765.

He possessed, according to my father, great facility in explaining any difficult subject; and he himself attributed this power to his habit of always talking about whatever he was studying, "turning and moulding the subject according to the capacity of his hearers." He compared himself to Gil Blas's uncle, who learned the grammar by teaching it to his nephew.

When he wished to make himself disagreeable for any good cause, he was well able to do so. Lady \* \* \* married a widower, and became so jealous of his former wife that she cut and spoiled her picture, which hung up in one of the rooms. The husband, fearing that his young wife was becoming insane, was greatly alarmed, and sent for Dr. Darwin. When he arrived he told her in the plainest manner many unpleasant truths, amongst others that the former wife was infinitely her superior in every respect, including beauty. The poor lady was astonished at being thus treated, and could never afterwards endure his name. He told the husband if she again behaved oddly, to hint that he would be sent for. The plan succeeded perfectly, and she ever afterwards restrained herself.

My father was much separated from Dr. Darwin after early life, so that he remembered few of his remarks, but he used to quote one saying as very true: "that the world was not governed by the clever men, but by the active and energetic." He used also to quote another saying, that "common

"sense would be improving, when men left off wearing as much flour on their heads as would make a pudding; when women left off wearing rings in their ears, like savages wear nose rings; and when fire-grates were no longer made of polished steel."

Dr. Darwin has been frequently called an atheist, whereas in every one of his works distinct expressions may be found showing that he fully believed in God as the Creator of the universe. For instance, in the 'Temple of Nature,' published posthumously,\* he writes: "Perhaps all the productions of nature are in their progress to greater perfection! an idea countenanced by modern discoveries and deductions concerning the progressive formation of the solid parts of the terraqueous globe, and consonant to the dignity of the creator of all things." He concludes one chapter in 'Zoonomia' with the words of the Psalmist: "*The heavens declare the Glory of God, and the firmament sheweth his handiwork.*"

\* 'Temple of Nature,' 1803, note, p. 54. See also the striking foot-note (p. 142) on the immutable properties of matter "received from the hand of the Creator," etc.

He published an ode on the folly of atheism, with the motto "I am fearfully and wonderfully made," of which the first verse is as follows:—

[1.

Dull atheist, could a giddy dance  
Of atoms lawless hurl'd  
Construct so wonderful, so wise,  
So harmonised a world?

With reference to morality he says: \* "The famous sentence of Socrates, 'Know yourself,' . . . . however wise it may be, seems to be rather of a selfish nature. . . . . But the sacred maxims of the author of Christianity, 'Do as you would be done by,' and 'Love your neighbour as yourself,' include all our duties of benevolence and morality; and, if sincerely obeyed by all nations, would a thousandfold multiply the present happiness of mankind."

Although Dr. Darwin was certainly a theist in the ordinary acceptation of the term, he disbelieved in any revelation. Nor did he feel much respect for unitarianism, for he used to say that "unitarianism was

\* 'Temple of Nature,' 1803, note p. 124.

a feather-bed to catch a falling Christian."

Remembering through what an exciting period of history Erasmus lived, it is singular how rarely there is more than an allusion in his letters to politics. He would now be called a liberal, or perhaps rather a radical. He seems to have wished for the success of the North American colonists in their war for independence; for he writes to Wedgwood (Oct. 17, 1782): "I hope Dr. Franklin will live to see peace, to see America recline under her own vine and fig-tree, turning her swords into plough-shares, &c." Like so many other persons, he hailed the beginning of the French Revolution with joy and triumph. Miss Seward, in a letter to Dr. Whalley, dated May 18, 1792, says: "I should indeed now begin to fear for France; but Darwin yet asserts that, in spite of all disasters, the cause of freedom will triumph, and France become, ere long, an example, prosperous as great, to the surrounding nations."

She remarks in another letter, Darwin "was

‘ a far-sighted politician, and foresaw and  
 “ foretold the individual and ultimate mis-  
 “ chief of every pernicious measure of the  
 “ late Cabinet.” \*

In February 1789, he tells Wedgwood that he had been reading ‘ Colonel Jack,’ by De Foe, and suggests that the account there given of the generous spirit of black slaves should be republished in some journal. Again, on April 13th of the same year (1789), he writes: “ I have just heard that  
 “ there are muzzles or gags made at Birming-  
 “ ham for the slaves in our islands. If this  
 “ be true, and such an instrument could be  
 “ exhibited by a speaker in the House of  
 “ Commons, it might have a great effect.  
 “ Could not one of their long whips or  
 “ wire tails be also procured and exhibited?  
 “ But an instrument of torture of our own  
 “ manufacture would have a greater effect,  
 “ I dare say.”

The following lines on Slavery were published in Canto III. of the ‘ Loves of the Plants,’ 1790 :—

\* ‘ Journals of Dr. Whalley, 1863, vol. ii. pp. 73, 220–222.

“ Throned in the vaulted heart, his dread resort,  
 Inexorable CONSCIENCE holds his court ;  
 With still small voice the plots of Guilt alarms.  
 Bares his mask’d brow, his lifted hand disarms ;  
 But wrapp’d in might with terrors all his own,  
 He speaks in thunder, when the deed is done.  
 Hear him, ye Senates ! hear this truth sublime,  
 He, who allows oppression, shares the crime.”

The date of this poem and of the above letter should be noticed, for let it be remembered that even the slave-trade was not abolished until 1807 ; and in 1783 the managers of the Society for the Propagation of the Gospel absolutely declined, after a full discussion, to give Christian instruction to their slaves in Barbadoes.\*

He sympathised warmly with Howard’s noble work of reforming the state of the prisons throughout Europe, as his lines in the ‘ Loves of the Plants ’ (Canto II.) show :—

“ And now, Philanthropy ! thy rays divine  
 Dart round the globe from Zembla to the line ;  
 O’er each dark prison plays the cheering light,  
 Like northern lustres o’er the vault of night.—  
 From realm to realm, with cross or crescent crown’d,  
 Where’er mankind and misery are found,

\* Lecky, ‘ Hist. of England in the Eighteenth Century,’ 1878, vol. ii. p. 17.

O'er burning sands, deep waves, or wilds of snow,  
 Thy Howard journeying seeks the house of woe—  
 Down many a winding step to dungeons dank,  
 Where anguish wails aloud, and fetters clank;  
 To caves bestrew'd with many a mouldering bone,  
 And cells, whose echoes only learn to groan;  
 Where no kind bars a whispering friend disclose,  
 No sunbeam enters, and no zephyr blows,  
 He treads, inemulous of fame or wealth,  
 Profuse of toil, and prodigal of health;  
 With soft assuasive eloquence expands  
 Power's rigid heart, and opes his clenching hands,  
 Leads stern-eyed Justice to the dark domains,  
 If not to sever, to relax the chains.

The spirits of the Good, who bend from high  
 Wide o'er these earthly scenes their partial eye,  
 When first, arrayed in Virtue's purest robe,  
 They saw her Howard traversing the globe;  
 Mistook a mortal for an Angel-Guest,  
 And ask'd what Seraph-foot the earth imprest.  
 Onward he moves! Disease and Death retire,  
 And murmuring demons hate him, and admire."

Judging from his published works, letters, and all that I have been able to gather about him, the vividness of his imagination seems to have been one of his pre-eminent characteristics. This led to his great originality of thought, his prophetic spirit both in science and in the mechanical arts, and to his overpowering tendency to theorise and generalise.

Nevertheless, his remarks, hereafter to be given, on the value of experiments and the use of hypotheses show that he had the true spirit of a philosopher. That he possessed uncommon powers of observation must be admitted. The diversity of the subjects to which he attended is surprising. But of all his characteristics, the incessant activity or energy of his mind was, perhaps, the most remarkable. Mr. Keir, himself a distinguished man, who had seen much of the world, and who "had been well acquainted " with Dr. Darwin for nearly half a century," after his death wrote (May 12th, 1802) to my father: "Your father did indeed retain more " of his original character than almost any " man I have known, excepting, perhaps, Mr. " Day [author of 'Sandford and Merton,' &c.]. " Indeed, the originality of character in both " these men was too strong to give way to " the example of others." He afterwards proceeds: "Your father paid little regard to " authority, and he quickly perceived the " analogies on which a new theory could be " founded. This penetration or sagacity by " which he was able to discover very remote

“ causes and distant effects, was the charac-  
 “ teristic of his understanding. Perhaps it  
 “ may be thought in some instances to have  
 “ led him to refine too much, as it is difficult  
 “ in using a very sharp-pointed instrument  
 “ to avoid sometimes going rather too deep.  
 “ By this penetrating faculty he was enabled  
 “ not only to trace the least conspicuous  
 “ indications of scientific analogy, but also  
 “ the most delicate and fugitive beauties of  
 “ poetic diction. If to this quality you add  
 “ an uncommon activity of mind and facility  
 “ of exertion, which required the constant  
 “ exercise of some curious investigation, you  
 “ will have, I believe, his principal features.”

His activity continued to his latest days; and the following letter, written when he was sixty-one years old to my father, shows his continued zeal in his profession.

ERASMUS DARWIN *to* HIS SON ROBERT.

DEAR ROBERT,

DERBY, *April* 13, 1792.

I think you and I should sometimes exchange a long medical letter, especially when any uncommon diseases occur; both as it improves one in writing

clear intelligible English, and preserves instructive cases. Sir Joshua Reynolds, in one of his lectures on pictorial taste, advised painters, even to extreme old age, to study the works of all other artists, both ancient and modern; which he says will improve their invention, as they will catch collateral ideas (as it were) from the pictures of others, which is a different thing from imitation; and adds, that if they do not copy others, they will be liable to copy *themselves*, and introduce into their work the same faces, and the same attitudes again and again. Now in medicine I am sure unless one reads the work of others, one is liable perpetually to copy one's *own* prescriptions, and methods of treatment; till one's whole practice is but an imitation of one's self; and half a score medicines make up one's whole *materia medica*; and the apothecaries say the doctor has but 4 or 6 prescriptions to cure all diseases.

Reasoning thus, I am determined to read all the new medical journals which come out, and other medical publications, which are not too voluminous; by which one knows what others are doing in the medical world, and can astonish apothecaries and surgeons with the new and wonderful discoveries of the times. All this harangue lately occurred to me on reading the trials made by Dr. Crawford.

\* \* \* \* \*

My father seems to have urged him, about the year 1793, to leave off professional work;

(c) Darwin Online (<http://darwin-online.org.uk/>)

he answered, "it is a dangerous experiment, " and generally ends either in drunkenness " or hypochondriacism. Thus I reason, " one must do something (so country squires " fox-hunt), otherwise one grows weary of " life, and becomes a prey to ennui. There- " fore one may as well do something advan- " tageous to oneself and friends or to mankind, " as employ oneself in cards or other things " equally insignificant." During his frequent and long journeys, he read and wrote much in his carriage, which was fitted up for the purpose. Nor was travelling an easy affair in those days, for owing to the state of the roads, a carriage could hardly reach some of the houses which he had to visit; and I hear from one of his granddaughters that an old horse named the " Doctor," with a saddle on, used to follow behind the carriage, without being in any way fastened to it; and when the road was too bad, he got out and rode upon Doctor. This horse lived to a great age, and was buried at the Priory.

When at home he was an early riser; and he had his papers so arranged (as I have heard from my father) that if he awoke in

the night he was able to get up and continue his work for a time, until he felt sleepy. Considering his indomitable activity, it is a singular fact that he suffered much from a sense of fatigue. On my once remarking to my father, how greatly fatigued he seemed to be after his day's work, he answered, "I " inherit it from my father."

In some notes made by my father in 1802, he states that Dr. Darwin naturally was of a bold disposition, but that a succession of accidents made a deep impression on his mind, and that he became very cautious. When he was about five years old he received an accidental blow on the top of his head, sufficiently severe to give him a white lock of hair for life. Later on, when he was fishing with his brothers, they put him into a bag with only his feet out, and being thus blinded he walked into the river, and was very nearly drowned. Again, when he and Lord George Cavendish were playing with gunpowder at school, it exploded, and he was badly injured; and lastly, he broke his kneecap.

Owing to his lameness, he was clumsy in his movements, but when young, was a very

active man. His frame was large and bulky, and he grew corpulent when old. He was deeply pitted with the small-pox.

It is remarkable that in so large a town as Derby, and at so late a period as 1784, there was no public institution for the relief of the poor in sickness. Dr. Darwin therefore at this time drew up a circular, the MS. of which is in my possession, stating that “as the small-pox has already made great ravages in Derby, showing much malignity even at its commencement; and as it is now three years since it was last epidemic in this town, there is great reason to fear that it will become very fatal in the approaching spring, particularly amongst the poor, who want both the knowledge and the assistance necessary for the preservation of their children.” He accordingly proposed that a society should be formed—the members to subscribe a guinea each, and that a room should be hired as a dispensary, where the medical men of the town might give their attendance gratuitously. The poor were to be directed to take their prescriptions in due order to all the druggists in the town, apparently to disarm opposition.

The circular then expresses the hope that the dispensary “may prove the foundation-stone of a future infirmary.”

In this same year of 1784 he seems to have taken the chief part in founding a Philosophical Society in Derby. The members met for the first time at his house, and he delivered to them a short but striking address, from which the following passages may be given: “I come now to the second source of our accurate ideas. As we are fashioned and constituted by the niggard hand of Nature with such imperfect and contracted faculties, with so few and such imperfect senses; while the bodies, which surround us, are indued with infinite variety of properties; with attractions, repulsions, gravitations, exhalations, polarities, minuteness, irresistance, &c., which are not cognizable by our dull organs of sense, or not adapted to them; what are we to do? shall we sit down contented with ignorance, and after we have procured our food, sleep away our time like the inhabitants of the woods and pastures? No, certainly!—since there is another way by which we may indirectly

“ become acquainted with those properties of  
 “ bodies, which escape our senses ; and that  
 “ is by *observing and registering their effects upon*  
 “ *each other.* This is the tree of knowledge,  
 “ whose fruit forbidden to the brute creation  
 “ has been plucked by the daring hand of  
 “ *experimental philosophy.*”

He concludes the address with the words:  
 “ I hope at some distant time, perhaps not  
 “ very distant, by our own publications we  
 “ may add something to the common heap  
 “ of knowledge ; which I prophecy will never  
 “ cease to accumulate, so long as the human  
 “ footstep is seen upon the earth.”

No man has ever inculcated more persistently and strongly the evil effects of intemperance than did Dr. Darwin ; but chiefly on the grounds of ill-health, with its inherited consequences ; and this perhaps is the most practical line of attack. It is positively asserted that he diminished to a sensible extent the practice of drinking amongst the gentry of the county.\*

\* The following short history of temperance societies is extracted from Dr. Krause's MS. notes on Dr. Darwin:—  
 “The oldest temperance societies were founded in North America in 1808 by the efforts of Dr. Rush, and in Great Britain in 1829, chiefly at the suggestion of Mr. Dunlop.

He himself during many years never touched alcohol under any form ; but he was not a bigot on the subject, for in old age he informed my father that he had taken to drink daily two glasses of home-made wine with advantage. Why he chose home-made wine is not obvious ; perhaps he fancied that he thus did not depart so widely from his long-continued rule. He also wrote (Oct. 15, 1772) to Wedgwood, who had feeble health : “ I would  
 “ advise you to live as high as your constitution  
 “ will admit of, in respect to both eating and  
 “ drinking. This advice could be given to very  
 “ few people ! If you were to weigh yourself  
 “ once a month you would in a few months  
 “ learn whether this method was of service to  
 “ you.” His advocacy of the cause is not yet

---

See Samuel Couling, ‘History of the Temperance Movement in Great Britain and Ireland, from the earliest date to the present time ;’ London, 1862. In Germany, indeed, the Archduke Frederick of Austria had founded a temperance order as early as 1439, which was followed in 1600 by the temperance order established by the Landgrave of Hesse, but these were only imitations of the Templars and other orders of knighthood, which sought by vows to suppress the coarse excesses of drinking bouts, as is indicated by the motto of the first-mentioned order : ‘Halt Maas !’ The suggestion of the establishment in Germany of true temperance societies on the American and English model was due to King Frederick William III.”

forgotten, for Dr. Richardson, in his address in 1879 to the "British Medical Temperance Association," remarks: "the illustrious Haller, Boerhaave, Armstrong, and particularly Erasmus Darwin, were earnest in their support of what we now call the principles of temperance."

When a young man he was not always temperate. Miss Seward relates\* a story, which would not have been worth notice had it not been frequently quoted. My grandfather went on a picnic party in Mr. Sneyd's boat down the Trent, and after luncheon, when (in Miss Seward's elegant language), "if not absolutely intoxicated, his spirits were in a high state of vinous exhilaration," he suddenly got out of the boat, swam ashore in his clothes, and "walked coolly over the meadows towards the town" of Nottingham. He there met an apothecary, whose remonstrances about his wet clothes he answered by saying that the unusual internal stimulus would "counteract the external cold and moisture;" he then mounted on a tub, and harangued the mob in an extremely sensible manner on

\* 'Memoirs of Dr. Darwin,' pp. 64-68.

sanitary arrangements. But it is obvious that these harangues must have been largely the work of Miss Seward's own imagination. There was, however, some truth in this story, for his widow, who did not believe a word of it, wrote to Mr. Sneyd, whose answer lies before me. He admits that something "similar" did happen, but gives no details, and advises Mrs. Darwin "to take no notice of this part of her (Miss Seward's) very unguarded and scandalous publication." To show what the gentry of the county thought of her book at the time, I will add that Mr. Sneyd, after alluding in the same letter to her account of the death of his son Erasmus, remarks: "The authoress deserves to be exposed for her want of veracity and every humane feeling." One of Dr. Darwin's stepsons (as I hear from his daughter) used always to maintain that this half-tipsy freak was due to some of the gentlemen of the party, "who were vexed at his temperate habits," having played him a trick; and this, I presume, means that he was persuaded to drink something as weak which was really strong.

The following incident related by Mr. Edgeworth \* illustrates the humane side of his character. Mr. Edgeworth had corresponded, as a stranger, with Dr. Darwin, about the construction of carriages, and came to Lichfield to see him, but did not find him at home. He was asked by Mrs. Darwin to stay to supper. "When this was nearly finished, a loud rapping at the door announced the doctor. There was a bustle in the hall, which made Mrs. Darwin get up and go to the door. Upon her exclaiming that they were bringing in a dead man, I went to the hall. I saw some persons, directed by one whom I guessed to be Doctor Darwin, carrying a man who appeared motionless. 'He is not dead,' said Dr. Darwin, 'he is only dead drunk. I found him,' continued the doctor, 'nearly suffocated in a ditch; I had him lifted into my carriage, and brought hither, that we might take care of him to-night.'" Not many men would have done anything so disagreeable as to bring home a drunken man in their carriage. When a light was

\* 'Memoirs of R. L. Edgeworth,' 2nd edit. vol. i. p. 158.

brought, the man was found to be, to the astonishment of all present, Mrs. Darwin's brother, "who for the first time in his life," as Mr. Edgeworth was assured, "had been intoxicated in this manner, and who would undoubtedly have perished had it not been for Dr. Darwin's humanity." We must remember that in those good old days it was not thought much of a disgrace to be very drunk. After the man had been put to bed, Mr. Edgeworth says that Dr. Darwin and he first discussed the construction of carriages and then various literary and scientific subjects, so that "he discovered that I had received the education of a gentleman." "Why, I thought," said the doctor, "that you were only a coachmaker." "That was the reason," said I, "that you looked so surprised at finding me at supper with Mrs. Darwin. But you see, doctor, how superior in discernment ladies are even to the most learned gentleman."

He was kind and considerate to his servants, as the two following stories show. His son Robert owed him a small sum of money, and instead of being paid, he asked Robert to buy

a goose-pie with it, for which it seems Shrewsbury was then famous, and send it at Christmas to an old woman living in Birmingham, "for she, as you may remember, was your nurse, which is the greatest obligation, if well performed, that can be received from an inferior." This was in the year 1793.

On the day of his death, in the early morning, whilst writing a long and affectionate letter to Mr. Edgeworth, he was seized with a violent shivering fit, and went into the kitchen to warm himself before the fire. He there saw an old and faithful maid servant churning, and asked her why she did this on a Sunday morning. She answered that she had always done so, as he liked to have fresh butter every morning. He said: "Yes, I do, but never again churn on a Sunday!"

That Dr. Darwin was charitable, we may believe on Miss Seward's testimony, as it is supported by concurrent evidence. After saying that he would not take fees from the priests and lay-vicars of the Cathedral of Lichfield, she adds: "Diligently, also, did he attend to the health of the poor in the city

"and afterwards at Derby, and supplied their necessities of food, and all sort of charitable assistance."\* Sir Brooke Boothby also, in one of his published sonnets, says:—

If bright example more than precept sway  
Go, take your lesson from the life of Day,  
Or, Darwin, thine whose ever-open door  
Draws, like Bethesda's pool, the suffering poor  
Where some fit cure the wretched all obtain  
Relieved at once from poverty and pain.

The gratitude of the poor to him was shown on two occasions in a strange manner.† Having to see a patient—one of the Cavendishes—at Newmarket during the races, he slept at an hotel, and during the night was awakened by the door being gently opened. A man came to his bedside and thus spoke

\* 'Memoirs of the Life of Dr. Darwin,' 1804, p. 5.

† These stories appear at first hardly credible, but I have traced them, more or less clearly, through four distinct channels to my grandfather, whose veracity has never been doubted by any one who knew him. The fundamental facts are the same with respect to the jocky story, but the accessories differ to an extreme degree. With respect to the second story even some of the fundamental facts differ, and I feel much doubt about it. It is quite curious how stories get unintentionally altered in the course of years. They were first communicated to me by a daughter of Violetta Darwin, who heard her mother relate them.

to him: "I heard that you were here, but  
 "durst not come to speak to you during the  
 "day. I have never forgotten your kind-  
 "ness to my mother in her bad illness, but  
 "have not been able to show you my grati-  
 "tude before. I now tell you to bet largely  
 "on a certain horse (naming one), and not  
 "on the favourite, whom I am to ride, and  
 "who we have settled is not to win." My  
 grandfather afterwards saw in the newspaper  
 that to the astonishment of everyone, the  
 favourite had not won the race.

The second story is, that as the doctor was  
 riding at night on the road to Nottingham a  
 man on horseback passed him, to whom he  
 said good night. As the man soon slackened  
 his pace, Dr. Darwin was forced to pass him,  
 and again spoke, but neither time did the man  
 give any answer. A few nights afterwards  
 a traveller was robbed at nearly the same  
 spot by a man who, from the description, ap-  
 peared to be the same. It is added that my  
 grandfather out of curiosity visited the robber  
 in prison, who owned that he had intended  
 to rob him, but added: "I thought it was you,  
 "and when you spoke I was sure of it. You

"saved my life many years ago, and nothing  
 "could make me rob you."\*

Notwithstanding so much evidence of Dr.  
 Darwin's benevolence and generosity, it has  
 been represented that he valued money in-  
 ordinatly, and that he wrote only for gain.  
 This is the language of a notice published  
 shortly after his death,† which also says that  
 he was very vain, and that "flattery was  
 "found to be the most successful means of  
 "gaining his notice and favour."

All that I have been able to learn goes to  
 show that this was a mistaken view of his  
 character.

In a letter to my father, dated Feb. 7, 1792,  
 he writes:

"As to fees, if your business pays you well  
 "on the whole, I would not be uneasy about  
 "making absolutely the most of it. To live  
 "comfortably all one's life, is better than to  
 "make a very large fortune towards the end  
 "of it."

In another letter not dated, but written in

\* In one version of this story, the visit of Dr. Darwin to the  
 man is not mentioned, so that there is then no point to the story.

† 'Monthly Magazine,' or 'British Register,' vol. xiii. 1802,  
 p. 457. Darwin Online (<http://darwin-online.org.uk/>).

1793, he remarks: "There are two kinds of  
 " covetousness, one the fear of poverty, the  
 " other the desire of gain. The former, I  
 " believe, at some times affects all people  
 " who live by a profession." Again, his son  
 Erasmus, in writing on Nov. 12, 1792, to my  
 father, after remarking how rich he was be-  
 coming, adds: "I am not afraid of being rich,  
 " as our father used to say at Lichfield he  
 " was, for fear of growing covetous; to avoid  
 " which misfortune, as you know, he used to  
 " dig a certain number of duck puddles  
 " every spring, that he might fill them up  
 " again in the autumn." How it was possible  
 to expend much money in digging duck  
 puddles, it is not easy to see.

It is probable that the only foundation for  
 the reviewer's statements, and for others of a  
 like kind, was the habit he had—perhaps a  
 foolish one—of often speaking about himself  
 in a quizzing or bantering tone. Mr. Edge-  
 worth, who had known him "intimately  
 " during thirty-six years," in answer to the  
 reviewer, writes:\*

"I am most anxious to contradict that

\* 'Monthly Magazine,' vol. ii. 1802, p. 115.

" assertion of the anonymous biographer,  
 " which I consider the most unfounded and  
 " injurious—that Dr. Darwin wrote chiefly  
 " for money. . . . It is not improbable  
 " that to avoid offensive adulation he might  
 " have said ironically that his object in  
 " writing was money, not fame. I have  
 " heard him say so twenty times, but I never  
 " for one moment supposed him to be in  
 " earnest. . . . It is asserted by the re-  
 " viewer 'that he stooped to accept of gross  
 " 'flattery.' Perhaps in the inmost recesses  
 " of his heart, vanity might reign without  
 " control, but no man exacted less tribute of  
 " applause in conversation. When the admi-  
 " rable *travestie* of his poetic style was pub-  
 " lished in the Anti-jacobin newspaper, I  
 " spoke of it in his presence in terms of  
 " strong approbation, and he appeared to  
 " think as I did, of the wit, ingenuity, and  
 " poetic merit of the parody." To ask the  
 author of the 'Loves of the Plants' to admire  
 the 'Loves of the Triangles' was putting his  
 temper through a severe ordeal. Mr. Keir,  
 who had known Dr. Darwin well for nearly  
 half a century, remarks in a letter (May 12,

1802): "The works of your father are a  
 " more faithful monument and more true  
 " mirror of his mind than can be said of  
 " those of most authors. For he was not  
 " one of those who wrote *invitâ Minervâ*, or  
 " from any other incitement than the ardent  
 " love of the subject."

Throughout his letters I have been struck with his indifference to fame, and the complete absence of all signs of any over-estimation of his own abilities or of the success of his works. I infer, from his having mentioned the fact to my father, that he was pleased by receiving a print of himself, "well done, I believe—proofs, 10s. 6d.—the first impression of which the engraver, Mr. Smith, believes will soon be sold, and he will then sell a second at 5s." He then adds: "but the great honour of all is to have one's head upon a sign-post, unless, indeed, upon Temple Bar!" This engraving was copied from the picture by Wright of Derby, of which a photograph is given in the present volume. Many pictures were made of him, but with one or two exceptions they are characterised by a rather morose and discon-

tented expression. Mr. Edgeworth, in writing to him about one of these pictures, says: "There is a cloud over your brow and a compression of the lips that hide your benevolence and good humour. And great author as you are, dear doctor, I think you excel the generality of mankind as much in generosity as in abilities."\*

I have said that, as far as I can judge, he was remarkably free from vanity, conceit, or display; nor does he appear to have been ambitious for a higher position in society. Miss Fielding, a granddaughter of Lady Charlotte Finch, governess to Queen Charlotte's daughters, was taken to Dr. Darwin, at Derby, on account of her health, and was invited to stay some time at his house. George the Third heard of my grandfather's fame through Lady Charlotte, and said: "Why does not Dr. Darwin come to London? He shall be my physician if he comes"; and he repeated this over and over again in his usual manner. But Dr. Darwin and his wife agreed that they disliked the thoughts of a London life so much, that the hint was not

\* 'Memoirs,' 2nd ed. vol. ii. p. 177.

acted on. Others have expressed surprise that he never migrated to London.

That he was irascible there can be no doubt. My father says "he was sometimes violent in his anger, but his sympathy and benevolence soon made him try to soothe or soften matters." Mr. Edgeworth also says:\* "Five or six times in my life I have seen him angry, and have heard him express that anger with much real, and more apparent vehemence—more than men of less sensibility would feel or show. But then the motive never was personal. When Dr. Darwin beheld any example of inhumanity or injustice, he never could refrain his indignation; he had not learnt, from the school of Lord Chesterfield, to smother every generous feeling."

In 1804 Miss Seward published her 'Life of Dr. Darwin.' It was unfortunate for his fame that she undertook this task, for she knew nothing about science or medicine, and the pretentiousness of her style is extremely disagreeable, not to say nauseous, to many

\* 'Monthly Magazine,' 1802, p. 115.

persons; though others like the book much. It abounds with inaccuracies, as both my father and other members of the family asserted at the time of its publication. For instance, she states that when dying he sent for Mrs. Darwin, and first asked her and then his daughter Emma to bleed him, and gives their answers in inverted commas. But the whole account is a simple fiction, for he expressly told his servant not to call Mrs. Darwin, but was disobeyed as the servant saw how ill he was; and his daughter was not even present. She does not even give his age at the time of his death correctly. It is also obvious that the many long speeches inserted in her book are the work of her own imagination, either with some or with no foundation.

She describes (p. 406) his conduct when he heard of the suicide of his son Erasmus, who drowned himself during a fit of temporary insanity, as inhuman to an unparalleled degree. She asserts that when he was told that the body "was found, he exclaimed in a low voice, 'Poor insane 'coward,' and, it is said, never afterwards mentioned the subject." Miss Seward then

proceeds (p. 408), "this self-command enabled  
 " him to take immediate possession of the  
 " premises bequeathed to him (by his son  
 " Erasmus); to lay plans for their improve-  
 " ment; to take pleasure in describing those  
 " plans to his acquaintance, and to determine  
 " to make it his future residence; and all this  
 " without seeming to recollect to how sad an  
 " event he owed their possession!"

The whole of this account is absolutely false, and when my father demanded her authority, she owned that it had been given merely on a report at a distant place, without any inquiry having been made from a single person who could have really known what happened. On the day after the death of his son (Dec. 30th, 1799), in a letter to my father, he says: "I write in great  
 " anguish of mind to acquaint you with a  
 " dreadful event—your poor brother Erasmus  
 " fell into the water last night at the bottom  
 " of his garden, and was drowned." His daughter Emma, who was with him when the news was brought to him that the body had been at last found, gave the following account of his behaviour to my mother: "He  
 " immediately got up, but staggered so much

" that Violetta and I begged of him to sit  
 " down, which he did, and leaned his head  
 " upon his hand . . . . he was exceedingly  
 " agitated, and did not speak for many  
 " minutes. His first words were, 'I beg you  
 " 'will not, any of you, ask to see your poor  
 " 'brother's corpse;' and upon our assuring  
 " him that we had not the least wish to do  
 " so, he soon after said that this was the  
 " greatest shock he had felt since the death of  
 " his poor Charles." Emma then asserts that Miss Seward's other statements are utterly false, namely, that he never afterwards mentioned his son's death, and that he took immediate possession of the property bequeathed to him. After alluding to other inaccuracies, in Miss Seward's book, Emma concludes in a truly feminine and filial spirit: "There is  
 " nothing else of such infinite consequence as  
 " her daring publicly to accuse my dear papa of  
 " want of affection and feeling towards his son.  
 " How can this be contradicted? I want to  
 " scratch a pen over all the lies, and send the  
 " book back to Miss Seward; but mamma  
 " won't allow this. She thinks you and my  
 " brother will think of a better plan; for  
 " myself, I should feel no objection to swear

“the truth of what I have said before both  
“houses of Parliament.”

In one of my grandfather's letters, dated Feb. 8th, 1800, he writes: “I am obliged as  
“executor daily to study his (Erasmus's) ac-  
“counts, which is both a laborious and  
“painful business to me.” A fortnight after-  
wards he tells my father about a monument  
to be erected to Erasmus, and adds: “Mrs.  
“Darwin and I intend to lie in Breadsall  
“church by his side.” Rarely has a more un-  
founded calumny been published about anyone  
than the above account given by Miss Seward  
of Dr. Darwin's behaviour when he heard of  
his son's death.\*

That the act of suicide was committed during  
temporary insanity there can be little doubt. It

\* Miss Seward published, on my father's demand, the follow-  
ing retraction in several journals, but such retractions are  
soon forgotten, and the stigma remains: “The authoress of the  
‘Memoirs of Dr. Darwin,’ since they were published, has dis-  
covered, on the attestation of his family and other persons pre-  
sent at the juncture, that the statement given of his exclamation,  
page 406, on the death of Mr. Erasmus Darwin, is entirely with-  
out foundation; and that the doctor, on that melancholy event,  
gave amongst his own family, proofs of strong sensibility at the  
time, and of succeeding regard to the memory of his son, which  
he seemed to have a pride in concealing from the world. In  
justice to his memory, she is desirous to correct the misinforma-  
tion she had received.” (‘Monthly Magazine,’ 1804, p. 378;  
and other journals and newspapers.)

is known that a change of disposition generally  
precedes insanity, and Erasmus, from being  
an excellent man of business, had become  
dilatory to an abnormal degree. It appears  
that he had neglected to do something of im-  
portance for my father; and my grandfather,  
nearly two years before Erasmus's death,  
wrote in his excuse to my father (Jan. 8th,  
1798) as follows: “I have not spoken to  
“him on your affairs, his neglect of small busi-  
“nesses (as he thinks them, I suppose,) is a  
“constitutional disease. I learnt yesterday that  
“he had like to have been arrested for a small  
“candle bill of 3 or 4 pounds in London, which  
“had been due 4 or 5 years, and they had  
“repeatedly written to him! and that a trades-  
“man in this town has repeatedly complained  
“to a friend of his that he owes Mr. D.  
“£70, and cannot get him to settle his ac-  
“count. I write all this to show you, that his  
“neglectful behaviour to you, was not owing  
“to any disrespect, or anger, but from what?  
“—*from defect of voluntary power.* Whence  
“he procrastinates for ever!”

He was evidently conscious himself of some  
mental change, for he purchased, six weeks

before his death, the small estate of the Priory, near Derby; where he intended, though only forty years old, to retire from business, and spend the rest of his days in quiet; or, as Dr. Darwin, who could not have foreseen what all this foreboded, expressed it (in a letter to my father, Nov. 28th, 1799), "to sleep away the remainder of his life."

Amongst the property of Erasmus my grandfather found a little cross made of platted grass (now in my possession) gathered from the tomb of Charles, who had died twenty years before. A week before his own death, he sent this to my father to be preserved.

The false reports about Dr. Darwin's conduct on the death of his son, probably originated in his strong dislike to affectation, or to any display of emotion in a man. He therefore wished to conceal his own feelings, and perhaps did so too effectually. My father writes: "He never would allow any common acquaintance to converse with him upon any subject that he felt poignantly. . . . It was his maxim, that in order to feel cheerful you must appear to be so." There

was, moreover, a vein of reserve in him. Miss Seward, in answer to a remark by my father, says (May 10th, 1802, i.e., before the publication of the 'Memoirs'): "Too well was I acquainted with the disposition and habits of your lamented father, to feel surprise from your telling me how little you had been able to gather from himself concerning the circumstances of his life, which preceded your birth, and those which passed beneath the unobservant eyes of sportive infancy."

The many friends and admirers of Dr. Darwin were indignant at Miss Seward's book, and thought that it showed much malice towards him. No such impression was left on my mind when lately re-reading it, but only that of scandalous negligence, together, perhaps, with a wish to excite attention to her book, by inserting any wild and injurious report about him. The friends, however, of Dr. Darwin were right, for in a letter, dated May 12th, 1802, written to the Rev. Dr. Whalley,\* before she published the Memoirs, she shows

\* 'Journals of Dr. Whalley,' edited by Wickham; not published until 1863, vol. i. p. 342.

her true colours, and gives an odious character of "that large mass of genius and sarcasm," as she calls him: She speaks of the "cold satiric atmosphere around him, repulsing the confidence and the sympathy of friendship." And adds in her usual stilted phrase, "Age did not improve his heart; and on its inherent frost, poetic authorism, commencing with him after middle life, engrafted all its irritability, disingenuous arts, and grudging jealousy of others' reputation in that science."

It is natural to inquire why Miss Seward wrote so bitterly about a man with whom she had lived on intimate terms during many years, and for whom she often expressed, and probably felt, the highest admiration. The only possible explanation appears to be that she had wished to marry him after the death of his first wife and before his second marriage. This was the case according to several members of the family, and I understood from my father that he possessed documentary evidence (subsequently destroyed) to this effect. This explains the following significant sentence in a letter written to her by

my father, March 5th, 1804, in relation to her account of the suicide of Erasmus: "Were I to have published my father's papers in illustration of his conduct, some circumstances must unavoidably have appeared, which would have been as unpleasant for you to read as for me to publish." Disappointed affection, with some desire for revenge, renders her whole course of conduct intelligible.

I may here allude to some calumnies about Dr. Darwin, which appeared in 1858 in the 'Life' of Mrs. Schimmelpenninck, who was a younger sister of Tertius Galton, Dr. Darwin's son-in-law. She there says that he scoffed at conscience and morality, disbelieved in God, and was a coarse glutton. These statements are hardly worth notice, as they were dictated in old age, she having seen Dr. Darwin, in her own words, only "with the eyes of a child." Nor was she always a trustworthy person. I have a copy of a letter written (Feb. 20th, 1871) by one of her nieces to Dr. Dowson, who had used her book in his 'Life of Dr. Darwin,' and nothing can be more explicit than the remarks about her un-

trustworthiness. One of her sisters also, in speaking of these statements, says: "They are facts distorted, and give a false impression." With regard to the charge of gluttony, as Dr. Darwin was a tall, bulky man, who lived much on milk, fruit, and vegetables, it is probable that he ate largely, as every man must do who works hard and lives on such a diet.

As it is interesting to see how far Erasmus Darwin transmitted his characteristic qualities of mind to his descendants, I will give a short account of his children. He had three sons by his first wife (besides two who died in infancy), and four sons and three daughters by his second wife. His eldest son, Charles (born September 3, 1758), was a young man of extraordinary promise, but died (May 15, 1778) before he was twenty-one years old from the effects of a wound received whilst dissecting the brain of a child. He inherited from his father a strong taste for various branches of science, for writing verses, and for mechanics. "Tools were his playthings," and making

"machines was one of the first efforts of his ingenuity, and one of the first sources of his amusement." \*

He also inherited stammering. With the hope of curing him, his father sent him to France when about eight years old (1766-67), with a private tutor, thinking that if he was not allowed to speak English for a time, the habit of stammering might be lost; and it is a curious fact that in after years when speaking French he never stammered. At a very early age he collected specimens of all kinds. When sixteen years old he was sent for a year to Oxford, but he did not like the place, and "thought (in the words of his father) that the vigour of the mind languished in the pursuit of classical elegance, like Hercules at the distaff, and sighed to be removed to the robuster exercise of the medical school of Edinburgh." He stayed three years at Edinburgh, working hard at his medical

\* These statements are taken chiefly from a sketch of his life published by his father, Erasmus, in 1780, together with two of his posthumous medical essays. See also Hutchinson's 'Biographia Medica,' 1799, vol. i. p. 239; also 'Biographie Universelle,' vol. x. 1855; also an article in the 'Gentleman's Magazine,' September 1st, 1794, vol. lxiv. p. 794, signed "A. D.," evidently Professor Andrew Duncan, of Edinburgh.

studies, and attending "with diligence all the sick poor of the parish of Waterleith, and supplying them with the necessary medicines." The Æsculapian Society awarded him its first gold medal for an experimental enquiry on pus and mucus. Notices of him appeared in various journals; and all the writers agree about his uncommon energy and abilities. He seems, like his father, to have excited the warm affection of his friends. Professor Andrew Duncan, in whose family vault Charles was buried, cut a lock of hair from the corpse, and took it to a jeweller, whose apprentice, afterwards the famous Sir H. Raeburn, set it in a locket for a memorial.\* The venerable professor spoke to me about him with the warmest affection forty-seven years after his death, when I was a young medical student in Edinburgh. The inscription on his tomb, written by his father, says, with more truth than is usual on such occasions: "Possessed of uncommon abilities and activity, he had acquired knowledge in every department of medical and philosophical science, much beyond his years."

\* 'Harveian Discourse,' by Professor A. Duncan, 1824.

Dr. Darwin was able to reach Edinburgh before Charles died, and had at first hopes of his recovery; but these hopes, as he informed my father, "with anguish," soon disappeared. Two days afterwards he wrote to Wedgwood to the same effect, ending his letter with the words, "God bless you, my dear friend, may your children succeed better." Two and a half years afterwards he again wrote to Wedgwood, "I am rather in a situation to demand than to administer consolation."

About the character of his second son, Erasmus (born 1759), I have little to say, for, though he wrote poetry, he seems to have had none of the other tastes of his father. He had, however, his own peculiar tastes, viz. genealogy, the collecting of coins, and statistics. When a boy he counted all the houses in the city of Lichfield, and found out the number of inhabitants in as many as he could; he thus made a census, and when a real one was first made, his estimate was found to be nearly accurate. His disposition was quiet and retiring. My father had a very high opinion of his abilities, and this was probably just, for he would not otherwise have been invited

to travel with, and pay long visits to, men so distinguished in different ways as Boulton the engineer, and Day, the moralist and novelist. He was certainly very ingenious. He detected by a singularly subtle plan the author of a long series of anonymous letters, which had caused, during six or seven years, extreme annoyance and even misery to many of the inhabitants of the county. The author was found to be a county gentleman of not inconsiderable standing. He was a successful solicitor in Lichfield, but his death, Dec. 30, 1799, was a sad one, as I have already mentioned.

The third son, Robert Waring Darwin (my father, born 1766), did not inherit any aptitude for poetry or mechanics, nor did he possess, as I think, a scientific mind. He published, in Vol. lxxvi. of the 'Philosophical Transactions,' a paper on Ocular Spectra, which Wheatstone told me was a remarkable production for the period; but I believe that he was largely aided in writing it by his father. He was elected a Fellow of the Royal Society in 1788. I cannot tell why my father's mind did not appear to me fitted

for advancing science; for he was fond of theorising, and was incomparably the most acute observer whom I ever knew. But his powers in this direction were exercised almost wholly in the practice of medicine, and in the observation of human character. He intuitively recognised the disposition or character, and even read the thoughts, of those with whom he came into contact with extraordinary acuteness. This skill partly accounts for his great success as a physician, for it impressed his patients with belief in him; and my father used to say that the art of gaining confidence was the chief element in a doctor's worldly success.

Erasmus brought him to Shrewsbury before he was twenty-one years old, and left him £20, saying, "Let me know when you want more, and I will send it you." His uncle, the rector of Elston, afterwards also sent him £20, and this was the sole pecuniary aid which he ever received. I have heard him say that his practice during the first year allowed him to keep two horses and a man-servant. Erasmus tells Mr. Edgeworth that his son Robert, after being settled in

Shrewsbury for only six months, "already had between forty and fifty patients." By the second year he was in considerable, and ever afterwards in very large, practice. His success was the more remarkable, as he for some time detested the profession, and declared that if he had been sure of gaining £100 a year in any other way he would never have practised as a doctor.

He had an extraordinary memory for the dates of certain events, so that he knew the day of the birth, marriage, and death of most of the gentlemen of Shropshire. This power, however, far from giving him any pleasure, annoyed him, for he told me that his memory for dates reminded him of painful events, and so added to his regret for the death of old friends. His spirits were generally high, and he was a great talker. He was of an extremely sensitive nature, so that whatever annoyed or pained him, did so to an extreme degree. He was also somewhat easily roused to anger. One of his golden rules was never to become the friend of any one whom you could not thoroughly respect, and I think he always acted on it. But of all his charac-

teristic qualities, his sympathy was pre-eminent, and I believe it was this which made him for a time hate his profession, as it constantly brought suffering before his eyes. Sympathy with the joy of others is a much rarer endowment than sympathy with their pains, and it is no exaggeration to say that to give pleasure to others was to my father an intense pleasure. He died November 13th, 1849. A short notice of his life appeared in the 'Proceedings of the Royal Society.'

Of the children of Erasmus by his second marriage, one son became a cavalry officer, a second rector of Elston, and a third, Francis (born 1786, died 1859), a physician, who travelled far in countries rarely visited in those days. He showed his taste for Natural History by being fond of keeping a number of wild and curious animals. I may add that one of his sons, Captain Darwin, is a great sportsman, and has published a little book, the 'Gamekeeper's Manual' (4th ed. 1863), which shows keen observation and knowledge of the habits of various animals. The eldest daughter of Erasmus, Violetta, married S. Tertius Galton, and I feel sure that their son,

Francis,\* will be willing to attribute the remarkable originality of his mind in large part to inheritance from his maternal grandfather.†

As Dr. Krause has so fully discussed Dr. Darwin's published writings I have but little to say about them. After settling at Lichfield, he attended, during several years, chiefly to medicine; but no doubt he was continually observing and making notes on various subjects. A huge folio common-place book, begun in 1776, is in the possession of Reginald Darwin and is half filled with notes and speculations. Considering how voluminous a writer he became when old, it is remarkable that he does not appear to have thought for a long time of publishing either prose or poetry. In a letter dated Nov. 21st, 1775, (ætat. 43) to

\* Author of "Hereditary Genius," "English Men of Science," and of other works and papers.

† In the interval between his first and second marriages, Dr. Darwin became the father of two illegitimate daughters. In our present state of society it may seem a strange fact that my grandfather's practice as a physician should not have suffered by his openly bringing up illegitimate children. But to his credit be it said that he gave them a good education, and from all that I have heard they grew up to be excellent women, and lived on intimate terms with his widow and the children by the second marriage.

Mr. Cradock,\* thanking him for a present of his 'Village Memoirs,' he says: "I have  
" for twenty years neglected the muses, and  
" cultivated medicine alone with all my in-  
" dustry . . . I lately interceded with  
" a Derbyshire lady to desist from lopping a  
" grove of trees, which has occasioned me to  
" try again the long-neglected art of verse-  
" making, which I shall inclose to amuse you,  
" promising, at the same time, never to write  
" another verse as long as I live, but to apply  
" my time to finishing a work on some branches  
" of medicine, which I intend for posthumous  
" publication."

In 1778 he purchased about eight acres of land near Lichfield, which he made into a botanic garden; and this seems to have been his chief amusement. "This wild umbrageous  
" valley . . . irriguous from various  
" springs, and swampy from their plenitude," as Miss Seward calls it,† now forms part of an adjoining park; and a Handbook for Lichfield describes it as still "a wild spot, but very  
" picturesque; many of the old trees remain-

\* 'Literary Memoirs,' 1828, vol. iv. p. 143.

† 'Memoirs of the Life of Dr. Darwin,' 1804, p. 125.

“ing, and occasionally a few Darwinian snow-  
“drops and daffodils peeping through the  
“turf, and bravely fighting the battle of life.”

This garden led him to write his poem of the ‘*Botanic Garden*,’ the second part of which, entitled the ‘*Loves of the Plants*,’ was published, oddly enough, before the first part called the ‘*Economy of Vegetation*.’ The ‘*Loves of the Plants*,’ judging from a prefixed sonnet, must have appeared in 1788, and the second edition in 1790. Miss Seward, in her life of Dr. Darwin, accuses him of having appropriated several of her verses, and of publishing them in this poem without any acknowledgment. The case is a very odd one; for first, she herself admits\* that it was entirely through his instrumentality that these verses were published with her name attached to them, before the appearance of the ‘*Botanic Garden*,’ in the ‘*Monthly Magazine*,’ and afterwards in the ‘*Annual Register*.’ Secondly, there seems to have been little temptation for the theft, for the whole history of his life shows that writing verses on any subject was not the least labour to him, but only a pleasure.

\* ‘*Memoirs of the Life of Darwin*,’ p. 132.

And thirdly, that Miss Seward remained on the same friendly, almost playful, terms with him afterwards as before. The whole case is unintelligible, and in some respects looks more like highway robbery than simple plagiarism. Mr. Edgeworth, in a letter (Feb. 3, 1812) to Sir Walter Scott,\* says that he had expressed surprise to Dr. Darwin at seeing Miss Seward’s lines at the beginning of his poem, and that Dr. Darwin replied: “It was a compliment  
“which he thought himself bound to pay to a  
“lady, though the verses were not of the same  
“tenor as his own.” But this seems a lame excuse, and it is an odd sort of compliment to take the verses without any acknowledgment. Perhaps he thought it fair play, for Edgeworth goes on to say that “Miss Seward’s ‘*Ode to Captain Cook*’ stands deservedly high  
“in public opinion. Now to my certain knowledge most of the passages which have been  
“selected in the various reviews of the work  
“were written by Dr. Darwin. . . . I knew  
“him well, and it was as far from his temper  
“and habits, as it was unnecessary to his  
“acquirements, to beg, borrow, or steal from  
“any person on earth.” These passages at

\* ‘*Memoirs of R. L. Edgeworth*,’ 2nd ed. 1821, vol. ii. p. 245.

any rate show how true and ardent a friend Edgeworth was to Dr. Darwin long after his death.

In a letter to my father, dated Feb. 21st, 1788, he says: "I am printing the 'Loves of the Plants,' which I shall not put my name to, tho' it will be known to many. But the addition of my name would seem as if I thought it a work of consequence." Notwithstanding this depreciatory estimate, its success was great and immediate; and I have heard my father, who was accurate about figures, say that a thousand guineas were paid before publication for the part which was published last; an amount which must have been something extraordinary in those days. Nor was the success quite transitory, for a fourth edition appeared in 1799. In 1806 an octavo edition of all his poetical works was published in three volumes. I have myself met with old men who spoke with a degree of enthusiasm about his poetry, quite incomprehensible at the present day. Horace Walpole, in his letters repeatedly alludes with admiration to Dr. Darwin's poetry, and in a letter to Mr. Barrett (May 14th, 1792) writes:—

"The 'Triumph of Flora,' beginning at the fifty-ninth line, is most beautifully and enchantingly imagined; and the twelve verses that by miracle describe and comprehend the creation of the universe out of chaos, are in my opinion the most sublime passages in any author, or in any of the few languages with which I am acquainted. There are a thousand other verses most charming, or indeed all are so, crowded with most poetic imagery, gorgeous epithets and style: and yet these four cantos do not please me equally with the 'Loves of the Plants.'" The lines thus eulogised are:—

"— Let there be light!" proclaimed the Almighty Lord.  
Astonished Chaos heard the potent word;—  
Through all his realms the kindling Ether runs,  
And the mass starts into a million suns;  
Earths round each sun with quick explosions burst,  
And second planets issue from the first;  
Bend, as they journey with projectile force,  
In bright ellipses their reluctant course;  
Orbs wheel in orbs, round centres centres roll,  
And form, self-balanced, one revolving whole.  
Onward they move amid their bright abode,  
Space without bound, the Bosom of their God!

(*The Botanic Garden*, part i. canto i. lines 103-114.)

(c) Darwin Online (<http://darwin-online.org.uk/>).

Mr. Edgeworth, in a letter (1790) to Dr. Darwin, writes about the 'Botanic Garden':\* "I may, however, without wounding your delicacy, say that it has silenced forever the complaints of poets, who lament that Homer, Milton, Shakespeare, and a few classics, had left nothing new to describe, and that elegant imitation of imitations was all that could be expected in modern poetry. . . . I read the description of the Ballet of Medea to my sisters, and to eight or ten of my own family. It seized such hold of my imagination, that my blood thrilled back through my veins, and my hair broke the cementing of the friseur to gain the attitude of horror." After the fame of his poetry had begun to wane, Edgeworth predicted (p. 117) "that in future times some critic will arise who shall rediscover the 'Botanic Garden,' and build his fame upon the discovery." "It will shine out again, the admiration of posterity."

Several poets addressed him in complimentary odes, as may be seen in the edition

\* 'Memoir of R. L. Edgeworth,' 2nd ed. 1821, vol. ii, p. 111.

of 1806. Cowper, who, one would have thought, differed in taste from him as much as one man could from another, yet, in conjunction with Hayley, wrote a poem in his honour,\* beginning:

No envy mingles with our praise,  
Tho' could our hearts repine  
At any poet's happier lays,  
They would, they must, at thine.

Notwithstanding the former high estimation of his poetry by men of all kinds in England, no one of the present generation reads, as it appears, a single line of it. So complete a reversal of judgment within a few years is a remarkable phenomenon. His verses were, however, quizzed by some persons not long after their publication. In the 'Pursuits of Literature,'† they are called:

"Filmy, gauzy, gossamery lines.

\* \* \* \* \*

Sweet tetrandrian, monogynian strains."

But the sudden downfall of his fame as a poet was in great part caused by the publication of the well-known parody the 'Loves of

\* Dated June 23, 1793, and published in the 'Monthly Magazine,' 1803, vol. ii. p. 100.

† 'Pursuits of Literature.' A Satirical Poem in Four Dialogues; 14th ed. 1808, p. 54.

the Triangles.' No doubt public taste was at this time changing, and becoming more simple and natural. It was generally acknowledged, under the guidance of Wordsworth and Coleridge, that poetry was chiefly concerned with the feelings and deeper workings of the mind; whereas, Darwin maintained that poetry ought chiefly to confine itself to the word-painting of visible objects. He remarks ('Loves of the Plants': Interlude between Cantos I. and II.) that poetry should consist of words which express ideas originally received by the organ of sight. ". . . And as our ideas derived from visible objects are more distinct than those derived from the objects of our other senses, the words expressive of these ideas belonging to vision make up the principal part of poetic language. That is, the poet writes principally for the eye; the prose writer uses more abstracted terms." It must be admitted that he was a great master of language. In one of the earliest and best criticisms on his poetry\* it is said no man "had a

\* 'Monthly Magazine or British Register,' 1802, vol. xiii. pp. 457-463.

"more imperial command of words, or could elucidate with such accuracy and elegance the most complex and intricate machinery." Byron called him "a mighty master of unmeaning rhyme."

His first scientific publication was a paper in the 'Philosophical Transactions' for 1757, in which he confutes the view of Mr. Eeles, that vapour ascends through "every particle, being endued with a portion of electric fire." The paper is of no value, but is curious as showing in what a rudimentary condition some branches of science then were. For Dr. Darwin remarks that the "distinction has not been sufficiently considered by anyone to my knowledge" between "the immense rarefaction of explosive bodies" due "to the escape of air before condensed in them," as when a few grains of gunpowder are exploded in a bladder, and to "the expansion of the constituent parts of those bodies" through heat, as with steam.

The following speculative letter (though not published) is interesting; but its date must be borne in mind in judging of its merits.

ERASMUS DARWIN to JOSIAH WEDGWOOD.

DEAR SIR,

March, 1784.

I admire the way in which you support your new theory of freezing steam. You say, "Will not vapour freeze with a less degree of cold than water in the mass? instances hoar-frost, &c." Now this same *et cætera*, my dear friend, seems to me to be a gentleman of such consequence to your theory, that I wish he would unfold himself a little more.

I sent an account of your experiment to Mr. Robert, and desired him to show it to Dr. Black, so that I shall hope some time to hear his opinion on the very curious fact you mention, of a part of ice (during a thaw) freezing whilst you applied a heated body to another part of it. Now in spite of your *et cætera*, I know no fact to ascertain that vapour will freeze with less cold than water. I can in no way understand why, during the time you apply a heated body to one part of a piece of ice, when the air of your room was at 50° and the ice had for a day or two been in a thawing state, that a congelation should be formed on another part of the same ice, but from the following circumstances. There is great analogy between the laws of the propagation of heat, and those of electricity, such as the same bodies communicate them easily, as metals, and the same bodies with more difficulty, as glass, wax, air: they are both excitable by friction, both give light, fuse metals,

*et cætera*. Therefore I suppose that atmospheres of heat of different densities, like atmospheres of electricity, will repel each other at certain distances, like globules of quicksilver pressed against each other, and that hence by applying a heated body near one end of a cold body, the more distant end may immediately become colder than the end nearest to the heated body.

March 11, 1784. Since I wrote the above I have reconsidered the matter, and am of opinion that steam, as it contains more of the element of heat than water, must require more absolute cold to turn it into ice, though the same sensible cold, as is necessary to freeze water, and that the phenomenon you have observed, depends on a circumstance which has not been attended to. When water is cooled down to freezing point, its particles come so near together, as to be within the sphere of their reciprocal attractions;—what then happens?—they accede with violence to each other and become a solid, at the same time pressing out from between them some air which is seen to form bubbles in ice and renders the whole mass lighter than water (on which it will swim) by this air having regained its elasticity; and pressing out any saline matters, as sea-salt, or blue vitriol, which have become dissolved in it; and lastly by thus forcibly acceding together, the particles of water press out also some more heat, as is seen by the rising of the thermometer immersed in such

freezing water. This last circumstance demands your nice attention, as it explains the curious fact you have observed. When the heat is so far taken away from water, that the particles attract each other, they run together with violence, and press out some remaining heat, which existed in their interstices. Then the contrary must also take place when you add heat to ice, so as to remove the particles into their reciprocal spheres of repulsion: they recede from each other violently, and thence attract more heat into their interstices; and if your piece of hot silver is become cold, and has no more heat to give, or if this thawing water in this its expansile state is in contact with other water which is saturated with heat, it will rob it of a part, or produce freezing if that water was but a little above  $32^{\circ}$ .

I don't know if I have expressed myself intelligibly. I shall relate an experiment I made twenty-five years ago, which confirms your fact. I filled a brewing-copper, which held about a hogshead and half, with snow; and immersed about half-an-ounce of water at the bottom of a glass tube in this snow, as near the centre as I could guess, and then making a brisk and hasty wood-fire under it, and letting the water run off by a cock as fast as it melted, I found in a few minutes on taking out the tube that the water in it was frozen. This experiment coincides with yours, and I think can only be explained on the above principle. In support of the above theory I can

prove from some experiments, that air when it is mechanically expanded always attracts heat from the bodies in its vicinity, and therefore water when expanded should do the same. But this would lengthen out my letter another sheet; I shall therefore defer it till I have the pleasure of a personal conference with you. Thus ice in freezing gives out heat suddenly, and in thawing gives out cold suddenly; but this last fact had not been observed (except in chemical mixtures) because when heat has been applied to thaw ice, it has been applied in too great quantities.

When shall we meet? Our little boy has got the ague, and will not take bark, and Mrs. Darwin is therefore unwilling to leave him, and begs to defer her journey to Etruria till later in the season. Pray come this way to London or from London. Our best compts. to all yours.

Adieu,

E. DARWIN.

P.S.—Water cooled beneath  $32^{\circ}$ , becomes instantly ice on any small agitation, or pouring out of one vessel into another, because that the accession of the particles to each other, and the pressing out of the air, or saline matters, and of heat is facilitated.

The 'Zoonomia,' which had been in preparation during many years, was published in

1794. We have seen that in 1775 it was intended for posthumous publication. Even so late as Feb. 1792, Dr. Darwin wrote to my father:—"I am 'studying my 'Zoonomia,' which I *think* I shall publish, in hopes of selling it, as I am now too old and hardened to fear a little abuse. Every John Hunter must expect a Jessy Foot to pursue him, as a fly bites a horse." The work when published was translated into German, French, and Italian, and was honoured by the Pope by being placed in the 'Index Expurgatorius.' Dr. Krause has given so full, impartial, and interesting an account of the scientific views contained in this and his other works that I need say little on this head. Although he indulged largely in hypotheses, he knew full well the value of experiments. Maria Edgeworth, in writing (March 9th, 1792) about her little brother Henry, who was fond of collecting and observing, says:—"He will at least never come under Dr. Darwin's definition of a fool. 'A fool, Mr. Edgeworth, you know, is a man who never tried an experiment in his life.'"\* Again, in an

\* 'Memoir of Maria Edgeworth,' 1867, vol. i. p. 31.

*Apology*, prefixed to the 'Botanic Garden,' we have the following just remarks:—"It may be proper here to apologise for many of the subsequent conjectures on some articles of natural philosophy, as not being supported by accurate investigation, or conclusive experiments. Extravagant theories, however, in those parts of philosophy, where our knowledge is yet imperfect, are not without their use; as they encourage the execution of laborious experiments, or the investigation of ingenious deductions to confirm or refute them. And since natural objects are allied to each other by many affinities, every kind of theoretic distribution of them adds to our knowledge by developing some of their analogies."

Dr. Darwin proved himself more ready to admit those new and grand views in chemistry (a branch of science which always greatly interested him) which were developed towards the close of the last century, than some professed chemists. James Keir, a distinguished chemist of the day, writing to him in March 1790, says\*: "You are such

\* 'Sketch of the Life of James Keir, F.R.S.' p. 111.

“ an infidel in religion that you cannot believe  
 “ in transubstantiation, yet you can believe  
 “ that apples and pears, &c., sugar, oil,  
 “ vinegar, are nothing but water and char-  
 “ coal, and that it is a great improvement in  
 “ language to call all these things by one  
 “ word—oxyde hydro-carbonneux.”

There is a good deal of psychology in the  
 ‘Zoonomia,’ but I fear that his speculations on  
 this subject cannot be held to have much  
 value. Nevertheless, G. H. Lewes says of  
 him \*: “ Although even more neglected than  
 “ Hartley by the present generation, Darwin,  
 “ once so celebrated, deserves mention here  
 “ as one of the psychologists who aimed at  
 “ establishing the physiological basis of mental  
 “ phenomena.” And again: “ Had Darwin  
 “ left us only the passage just cited † we  
 “ should have credited him with a profounder  
 “ insight into psychology than any of his  
 “ contemporaries and the majority of his suc-  
 “ cessors exhibit; and although the perusal of  
 “ ‘Zoonomia’ must convince everyone that  
 “ Darwin’s system is built up of absurd hypo-

\* ‘History of Philosophy,’ 3rd ed. 1867, vol. ii. p. 356.

† ‘Zoonomia,’ vol. i. p. 27.

“ theses, Darwin deserves a place in history  
 “ for that one admirable conception of psy-  
 “ chology as subordinate to the laws of life.”  
 The illustrious Johannes Müller quotes with  
 approbation, though with correction, his ‘law  
 of associated movements.’ \*

The ‘Zoonomia’ is largely devoted to  
 medicine, and my father thought that it had  
 much influenced medical practice in England;  
 he was of course a partial, yet naturally a more  
 observant judge than others on this point. The  
 book when published was extensively read by  
 the medical men of the day, and the author  
 was highly esteemed by them as a practitioner.  
 The following curious story, written down by  
 his daughter, Violetta, in her old age, shows  
 his repute as a physician. A gentleman in  
 the last stage of consumption came to Dr.  
 Darwin at Derby, and expressed himself to  
 this effect: “ I am come from London to con-  
 “ sult you, as the greatest physician in the  
 “ world, to hear from you if there is any hope  
 “ in my case; I know that my life hangs upon  
 “ a thread, but while there is life there may

\* Müller’s ‘Elements of Physiology,’ translated by Baly, 1842,  
 p. 943.

(c) Darwin Online (<http://darwin-online.org.uk/>).

“be hope. It is of the utmost importance  
 “for me to settle my worldly affairs immedi-  
 “ately; therefore I trust that you will  
 “not deceive me, but tell me without hesi-  
 “tation your candid opinion.” Dr. Darwin  
 felt his pulse, and minutely examined him,  
 and said he was sorry to say there was no  
 hope. After a pause of a few minutes the  
 gentleman said: “How long can I live?”  
 The answer was: “Perhaps a fortnight.” The  
 gentleman seized Dr. Darwin’s hand and said:  
 “Thank you, doctor, I thank you; my mind  
 “is satisfied; I now know there is no hope for  
 “me.” Dr. Darwin then said: “But as you  
 “come from London, why did you not consult  
 “Dr. Warren, so celebrated a physician?”  
 “Alas! doctor, I am Dr. Warren.” He died  
 in a week or two afterwards.

I remember only two points, with respect  
 to which my father thought that medical  
 practice in this country had been influenced  
 by the ‘Zoonomia.’\* In this work it is said:  
 “There is a golden rule by which the neces-

\* ‘Zoonomia,’ 1794, vol. i. p. 99. I was led to search for  
 this passage by its having been given by Dr. Dowson in his  
 ‘Erasmus Darwin: Philosopher, Poet, and Physician,’ 1861,  
 p. 46.

“sary and useful quantity of stimulus in  
 “fevers with debility may be ascertained.  
 “When wine or beer is exhibited, either  
 “alone or diluted with water, if the pulse  
 “becomes slower the stimulus is of a proper  
 “quantity, and should be repeated every two  
 “or three hours, or when the pulse again  
 “becomes quicker.” The value of this  
 “golden rule” will be appreciated when it  
 is remembered that the high importance of  
 stimulants in fever has only rather recently  
 been recognised and acted on. His views  
 on fever certainly attracted attention at the  
 time;\* but the use of stimulants in such  
 cases has fluctuated much, and the history  
 of the subject is an obscure one, as I infer  
 from a letter which Sir Robert Christison  
 has had the kindness to send me.

The second point mentioned by my father,  
 was the treatment of the insane. After say-  
 ing† that no lunatic should be restrained  
 unless he be dangerous, Dr. Darwin urges  
 that in some cases “confinement retards

\* See, for instance, Dr. Baeta’s work, ‘Comparative View of  
 the Theories and Practice of Drs. Cullen, Brown, and Darwin’:  
 published in 1800.

† ‘Zoonomia,’ vol. ii. 1796, p. 352. (<http://www.gutenberg.org.uk/>)

“rather than promotes their cure, which is  
 “forwarded by change of ideas, &c.” He  
 then remarks that mistaken ideas do not by  
 themselves justify confinement, and adds:  
 “If everyone who possesses mistaken ideas,  
 “or who puts false estimates on things, was  
 “liable to confinement, I know not who of  
 “my readers might not tremble at the sight  
 “of a madhouse.”

In connection with this subject, the follow-  
 ing quotation from Dr. Maudsley is interest-  
 ing:\* “Here I may fitly take occasion to  
 “adduce certain observations with regard  
 “to the striking manner in which diseased  
 “action of one nervous centre is sometimes  
 “transferred suddenly to another, a fact  
 “which, though it has lately attracted new  
 “attention, was long since noticed and com-  
 “mented on by Dr. Darwin: ‘In some con-  
 “vulsive diseases,’ he writes, ‘a delirium  
 “or insanity supervenes, and the convul-  
 “sions cease; and conversely, the convul-  
 “sions shall supervene, and the delirium  
 “cease. Of this I have been a witness

\* ‘Pathology of Mind,’ 1879, p. 229.

“ ‘many times a day, in the paroxysms of  
 “ ‘violent epileptics, which evinces that one  
 “ ‘kind of delirium is a convulsion of the  
 “ ‘organs of sense, and that our ideas are  
 “ ‘the motions of those organs.’ ”

Dr. Lauder Brunton has mentioned to me  
 another instance in which Dr. Darwin appa-  
 rently anticipated a modern discovery.

In an article in the ‘British Medical Journal’  
 (1873, p. 735) on “catching cold,” Dr. Brun-  
 ton gives an account of Rosenthal’s experi-  
 ments, showing that when an animal is  
 exposed to a rather high temperature, “the  
 “cutaneous vessels become paralysed by the  
 “heat, and remain dilated even after cold  
 “has been applied. The blood is thus ex-  
 “posed over a large surface, and becomes  
 “rapidly cooled.” For instance, the blood  
 of an animal thus treated fell from between  
 107·6° and 111° to 96·8°, and remained at  
 this lower temperature for several days. A  
 passage in the *Zoonomia*\* seems to show  
 that Dr. Darwin was acquainted with the  
 above important fact, discovered by Rosen-  
 thal some hundred years later.

\* ‘Zoonomia,’ vol. ii, 1796, p. 570.  
 (c) Darwin Online (<http://darwin-online.org.uk/>)

Dr. Darwin fully recognised the truth and importance of the principle of inheritance in disease. He remarks: \* "As many families become gradually extinct by hereditary diseases, as by scrofula, consumption, epilepsy, mania, it is often hazardous to marry an heiress, as she is not unfrequently the last of a diseased family." His grandson, Francis Galton, so well known for his works on the subject of inheritance, would fully appreciate this remark. On the other hand, when a tendency to disease is confined to one parent, the children often escape. "I now know," as he writes to my father, January 5th, 1792, "many families who had insanity on *one* side, and the children, now old people, have had no symptom of it. If it were otherwise, there would not be a family in the kingdom without epileptic, gouty, or insane people in it."

In 'The Temple of Nature' (Notes, p. 11), there is a curious instance of his prophetic sagacity with respect to "microscopic animals." A few years since a utilitarian philo-

\* 'The Temple of Nature,' 1803, notes, p. 45; published after his death.

sopher might have sneered at men spending their lives in the examination of organisms far too minute to be seen by the naked eye; and it would have been difficult to have given a satisfactory answer, except on general principles, to such a man. But we now know from the researches of various naturalists how all-important a part these organisms play in putrefaction, fermentation, infectious diseases, &c.; and as a consequence of such researches, the world owes a deep debt of gratitude to Mr. Lister for his anti-septic treatment of wounds. Therefore the following sentence of my grandfather, considering how little was then known on the subject, appears to me remarkable. He says: "I hope that microscopic researches may again excite the attention of philosophers, as unforeseen advantages may probably be derived from them like the discovery of a new world."

The 'Phytologia,' was published in 1800. It begins with a discussion on the nature of leaf-buds and flower-buds; and the view, now universally adopted, that a plant consists of "a system of individuals," and not merely of a multiplication of similar organs, originated

with Darwin, as I infer from Johannes Müller's 'Elements of Physiology.'\*

Considering how recently the manner in which plants modify and absorb the nutriment stored up in their roots, tubers, cotyledons, &c. has been understood, the following sentence ('Phytologia,' p. 77) deserves notice: "The digestive powers of the young vegetable, with the chemical agents of heat and moisture, convert the starch or mucilage of the root or seed into sugar for its own nourishment; . . . and thus it appears probable that sugar is the principal nourishment of both animal and vegetable beings."

The work treats largely of agriculture and horticulture, and a section is devoted to phosphorus, which, as he believes (p. 207), exists universally in vegetables, a question "which has not yet been sufficiently attended to." He then refers to the use of bones as a manure, but erred in supposing that shells and some other substances which are luminous in the dark, abounded with phosphorus. Sir J. Sinclair, President of the Board of Agriculture, and

\* 'Elements of Physiology,' translated by Baly, 1842, p. 1421.

therefore a most capable judge, says that, though the fertilising properties of bone-dust had been previously noticed by Hunter, yet "they were first theoretically explained and brought forward with authority by Dr. Darwin." He then remarks, and of the truth of his remark there can be little doubt, "perhaps no (other) modern discovery has contributed so powerfully to improve the fertility and to increase the produce of the soil."\*

The following sentences are interesting as forecasting the progress of modern thought. In a discussion on "The Happiness of Organic Life" (p. 556), after remarking that animals devour vegetables, he says: "The stronger locomotive animals devour the weaker ones without mercy. Such is the condition of organic nature! whose first law might be expressed in the words, 'eat or be eaten,' and which would seem to be one great slaughter-house, one universal scene of rapacity and injustice." He proceeds: "Where shall we find a benevolent idea to console us amid so much apparent misery?"

\* I am indebted to Dr. Dowson's 'Life of Erasmus Darwin,' for the reference to the 'Life and Works of Sir J. Sinclair.'

He then argues : "Beasts of prey more easily  
 " catch and conquer the aged and infirm, and  
 " the young ones are defended by their  
 " parents. . . . . By this contrivance more  
 " pleasurable sensation exists in the world  
 " . . . . old organisations are transmigrated  
 " into young ones . . . . death cannot so  
 " properly be called positive evil as the ter-  
 " mination of good." There is much more of  
 the same kind, and hardly more relevant.  
 He then makes a great leap in his argument,  
 and concludes that all the strata of the world  
 " are monuments of the past felicity of organ-  
 " ised nature ! and consequently of the bene-  
 " volence of the Deity !"

It is a curious proof of the degree to which  
 English botanists had been blinded by the  
 splendour of the fame of Linnæus, that Dr.  
 Darwin apparently had never heard of Jussieu,  
 for he writes (p. 564) : "If the system of the  
 " great Linnæus can ever be intrinsically im-  
 " proved, I am persuaded that the plan here  
 " proposed of using the situations, propor-  
 " tions, or forms, with or without the number  
 " of the sexual organs, as criterions of the  
 " orders and classes, must lay the foundation ;

" but that it must require a great architect  
 " to erect the superstructure." He therefore  
 did not know that a noble superstructure had  
 already been raised.

There remains only one other book to  
 be noticed : 'A Plan for the Conduct of  
 Female Education in Boarding Schools,' pub-  
 lished in 1797. This is a short treatise which  
 seems never to have received much attention  
 in England, though it was translated into  
 German. It is strongly characterised by plain  
 common sense, with little theorising, and is  
 throughout benevolent. He insists that  
 punishment should be avoided as much as  
 possible, and that reproof should be given  
 with kindness. Emulation, though useful, is  
 dangerous, from being liable to degenerate  
 into envy. "If once you can communicate  
 " to children a love of credit and an appre-  
 " hension of shame, you have instilled into  
 " them a principle, which will constantly act  
 " and incline them to do right, though it is  
 " not the true source whence our actions  
 " ought to spring, which should be from our  
 " duty to others and ourselves." He urges  
 that sympathy with the pains and pleasures

of others is the foundation of all our social virtues; and that this can best be inculcated by example and the expression of our own sympathy. "Compassion, or sympathy with  
 " the pains of others, ought also to extend to  
 " the brute creation . . . to destroy even  
 " insects wantonly, shows an unreflecting  
 " mind, or a depraved heart."

× He considers it of great importance to girls that they should learn to judge of character, as they will some day have to choose a husband; and he believes that reading proper novels teaches them something of life and mankind, and helps them to avoid mistakes in judging of character. He also remarks more than once, that children express various emotions in their countenances much more plainly than older persons; and he is convinced that one great advantage which a child derives from going to school is in unconsciously acquiring a knowledge of physiognomy through mixing with other children. This knowledge, "by giving a promptitude  
 " of understanding the present approbation  
 " or dislike, and the good or bad designs of  
 " those whom we converse with, becomes of

" hourly use in almost any department of  
 " life."

He was much in advance of his age in his ideas as to sanitary arrangements—such as supplying towns with pure water, having holes made into crowded sitting and bedrooms for the constant admission of fresh air, and not allowing chimneys to be closed during summer, and as to diet and exercise. He speaks of "skating on the ice in winter, "swimming in summer, funambulation or "dancing on the straight rope," as "not  
 " allowed to ladies by the fashion of this age  
 " and country." It is a pity he does not tell us when and where it was the fashion of young ladies to funambulate! × With respect to swimming, he disregarded fashion, and had his own daughters as well as his sons taught to swim at a very early age, so that they became, it is said, expert swimmers as early as four years old. In the 'Phytologia' he shows himself still more clearly a great sanitary reformer. × He insists that the sewage from towns, which is now left buried or carried into the rivers, should be removed for the purpose of agriculture; "and thus the

“purity and healthiness of the towns may  
 “contribute to the thriftiness and wealth of  
 “the surrounding country.” “There should  
 “be no burial places in churches or in church-  
 “yards, where the monuments of departed  
 “sinners shoulder God’s altar, . . . but  
 “proper burial grounds should be consecrated  
 “out of towns.” Nearly a century has  
 elapsed since this good advice was given,  
 and it has as yet only partially been carried  
 out.

One of the subjects which interested Dr. Darwin most throughout his whole life, and which appears little in his published works, was mechanical invention. This is shown in his letters to Josiah Wedgwood, Edgeworth, and others, and in a huge common-place book full of sketches and suggestions about machines. He seems, however, rarely to have completed anything, with the exception of a horizontal windmill for grinding flints, which he designed for Wedgwood, and which answered its purpose. There are schemes and sketches for an improved lamp, like our present moderators; candlesticks with telescope stands

so as to be raised at pleasure to any required height; a manifold writer; a knitting loom for stockings; a weighing machine; a surveying machine; a flying bird, with an ingenious escapement for the movement of the wings, and he suggests gunpowder or compressed air as the motive power. He also gives a plan of a canal lock, on the principle of the boat being floated into a large box, the door of which is then closed, and the box afterwards raised or lowered. This principle has since been acted on under certain circumstances, but by an improved method. A rotatory pump was also one of his schemes, and this, under a modified form, is extensively used for blowing air into smelting cupolas, and for pumping water in certain cases. He saw clearly, as he explains in 1756 in a letter to Reimarus, that it would be a great advantage if the spokes of carriage wheels acted as springs; and Sir J. Whitworth has recently had a carriage constructed with such wheels, which is remarkably smooth.

Another invention was a small carriage of peculiar construction, intended to give the best effect to the power of the horse, combined

with the greatest ease in turning. "It was  
 "a platform," says Miss Seward, "with a  
 "seat fixed upon a very high pair of wheels,  
 "and supported in the front upon the back  
 "of the horse, by means of a kind of pro-  
 "boscis, which, forming an arch, reached over  
 "the hind quarters of the horse; and passed  
 "through a ring, placed on an upright piece  
 "of iron, which worked in a socket, fixed in  
 "the saddle."\* But however correct this  
 carriage may have been in principle, Darwin  
 had the misfortune, in the year 1768, to be  
 upset in it, when he broke his knee-cap and  
 ever afterwards limped a little.

A speaking machine was a favourite idea,  
 and for this end he invented a phonetic alpha-  
 bet. His machine, or "head, pronounced the  
 "p, b, m, and the vowel a, with so great  
 "nicety as to deceive all who heard it unseen,  
 "when it pronounced the words *mama, papa,*  
 "*map, and pam*; and it had a most plain-

\* Dr. Krause informs me "that the Moravian engineer, Theodo-  
 "Tomatschek, has lately constructed a very similar carriage,  
 "which I saw at the Vienna International Exhibition; and the  
 "Americans have also reduced the Darwinian idea to practice,  
 "and given the new vehicle the paradoxical name 'Equibus.'"

"tive tone, when the lips were gradually  
 "closed."\* Edgeworth also bears witness to  
 the capacity of this speaking head. Matthew  
 Boulton entered into the following agreement,  
 which, from the witnesses to it, was evidently  
 made at one of the meetings of the famous  
 Lunar Club; but whether in joke or earnest,  
 it is difficult to conjecture:

I promise to pay to Dr. Darwin of Lichfield  
 one thousand pounds upon his delivering to me  
 (within 2 years from date hereof) an Instrument  
 called an organ that is capable of pronouncing the  
 Lord's Prayer, the Creed, and Ten Commandments  
 in the Vulgar Tongue, and his ceding to me, and me  
 only, the property of the said invention with all the  
 advantages thereunto appertaining.

M. Boulton

Soho Sep. 3rd 1877

Witness, James Keir

Witness, W. Small

In the last century a speaking tube was an  
 unknown invention in country districts, and

\* 'Temple of Nature,' notes, p. 120; p. 107 on the phonetic  
 alphabet. See also 'Memoirs of Edgeworth,' vol. ii. p. 178.

Dr. Darwin had one for his study, which opened near the back of the kitchen fire-place. A countryman had brought a letter and sat waiting for an answer by this fire, which had become very low, when suddenly he heard a sepulchral voice, saying, as if from the depths of the expiring fire, "I want some coals." The man instantly fled from the house, for my grandfather had the reputation amongst the country folk of being a sort of magician.

At a time (1783) when very few artesian wells had been made in this country, Dr. Darwin made one, though on a small scale; and in the garden-wall to his house in Full Street, Derby, there still exists an iron plate with the following inscription :

TERREBELLO EDUXIT AQUAM  
ANNO MDCCLXXXIII.  
ERASMUS DARWIN.  
LABITUR ET LABETUR.

This case would not have been worth mentioning had he not shown in his paper,\* in

\* 'Philosophical Transact.' 1785, part i. p. 1.

which this well is described, that he recognised the true principle of artesian wells. He remarks that "some of the more interior strata of the earth are exposed naked on the tops of mountains; and that in general, those strata which lie uppermost, or nearest to the summit of the mountain, are the lowest in the contiguous plains." He then adds that the waters "sliding between two of the strata above described, descend till they find or make for themselves an outlet, and will in consequence rise to a level with the parts of the mountain where they originated."

In Oct. 1771 he wrote several letters to Wedgwood about a scheme of making, with his own capital, a canal of very small dimensions from the Grand Trunk to Lichfield, for boats drawing only a foot of water, to be dragged by a man, and carrying only four or five tons burthen. Such a canal would have borne the same relation to ordinary canals, as some very narrow railways, which have been found to answer well in Wales, bear to ordinary railways. He seems to have been greatly

interested in this project, which, however, never came to anything.

The weather, and the course of the winds throughout the world, was another subject on which he was continually searching for information and speculating. I have heard my father say, that in order to notice every change of the wind he connected a wind-vane on the top of his house with a dial on the ceiling of his study.

There remains only to be said that Erasmus Darwin died at Breadsall Priory, near Derby, on Sunday morning, April 18th, 1802, in his seventy-first year. A week previously he had been ill for a few days, but had recovered. On the 17th, whilst walking in his garden with a lady, he told her that he did not expect to live long. At night he was as cheerful as usual. On the following morning, the 18th, he rose at six o'clock and wrote a long letter to Mr. Edgeworth\* which he did not live to finish, and which contains the following description of the Priory, where he had

\* R. L. Edgeworth's 'Memoirs,' 2nd ed., vol. ii. p. 242.

BREADSALL PRIORY, WHERE ERASMUS DARWIN DIED.

been living for about two years: "We have  
 " a pleasant house, a good garden, ponds full  
 " of fish, and a pleasing valley somewhat like  
 " Shenstone's—deep, umbrageous, and with a  
 " talkative stream running down it. Our  
 " house is near the top of the valley, well  
 " screened by hills from the east and north,  
 " and open to the south, where, at four miles  
 " distance, we see Derby tower." At about  
 seven o'clock he was seized with a violent  
 shivering fit, and went into the kitchen to  
 warm himself; he returned to his study, lay  
 on the sofa, became faint and cold, and was  
 moved into an arm-chair, where without pain  
 or emotion of any kind he expired a little  
 before nine o'clock.

A few years before he had written to Edge-  
 worth: "When I think of dying, it is always  
 without pain or fear;" but he had often ex-  
 pressed a strong hope that his end might be  
 painless, and so it proved. His medical attend-  
 ants differed about the cause of his death, but  
 my father did not doubt that it was an affec-  
 tion of the heart. Many years afterwards his  
 widow showed me the sofa and chair, still  
 preserved in the same place, where he had lain

and expired. He was buried in Breadsall  
 Church.

ERASMUS DARWIN, M.D., F.R.S.

Born at Elston, near Newark, 12th Dec., 1731.  
 Died at the Priory, near Derby, 10th April, 1802.

Of the rare union of Talents  
 which so eminently distinguished him  
 as a Physician, a Poet and Philosopher

His writings remain  
 a public and unfading testimony.

His Widow

has erected this monument

in memory of

the zealous benevolence of his disposition,  
 the active humanity of his conduct,  
 and the many private virtues  
 which adorned his character.

THE SCIENTIFIC WORKS  
OF  
ERASMUS DARWIN.

By ERNST KRAUSE.

TRANSLATED FROM THE GERMAN BY W. S. DALLAS, F.L.S.

On the second page of the later editions of Darwin's 'Origin of Species' \* we find the following brief observation:—"It is curious how largely my grandfather, Dr. Erasmus Darwin, anticipated the views and erroneous grounds of opinion of Lamarck in his 'Zoonomia' (vol. i. pp. 500-510), published in 1794." Being quite aware of the reticence and modesty with which the author expresses himself, especially in speaking *pro domo*, I thought immediately that here we ought to read between the lines, and that this ancestor of his must certainly deserve considerable credit in connection with the history of the Darwinian theory. As no light was to be obtained upon this subject from German literature I procured the works of Erasmus Darwin, and have found singular pleasure in their study.

I was speedily convinced that this man,

\* Sixth edition, p. xiv. note.

is one thing to establish hypotheses and theories out of the fulness of one's fancy, even when supported by a very considerable knowledge of nature, and another to demonstrate them by an enormous number of facts, and carry them to such a degree of probability as to satisfy those most capable of judging. Dr. Erasmus Darwin could *not* satisfy his contemporaries with his physio-philosophical ideas; he was a century ahead of them, and was in consequence obliged to put up with seeing people shrug their shoulders when they spoke of his wild and eccentric fancies, and the expression "Darwinising" (as employed for example by the poet Coleridge when writing on Stillingfleet) was accepted in England nearly as the antithesis of sober biological investigation.\*

The many-sidedness of his endowments also injured his fame in another direction. The physicians reproached him with being a philosopher; and the philosophers thought themselves justified in complaining that he was of far too poetical and fanciful a constitution; the poets and *literati* on the other

\* See 'Athenæum,' March, 1875, p. 423.

hand objected to his position as a physician and his scientific tendencies; and thus partiality and prejudice prevented his judges from a full and complete recognition of the value of the man. His life and labours have frequently been described, but always by either *littérateurs* or medical men, and hence the picture produced has always had a partizan colouring.

Nevertheless it is gratifying to find that each of his biographers has expressed the highest appreciation of precisely that side of the doctor's activity of which he was most capable of judging. The *literati* formerly extolled his poetical merits. Eighteen years ago an English physician praised his medical contributions; and it has remained for the present writer to add to these the hitherto neglected tribute of recognition\* which is due to him on the part of natural history and physio-philosophy.

It is characteristic of this distinguished man that he never exhibited those fluctuating opinions with respect to the evolution of organic beings which are evident in the works of Linnæus and Buffon.

(c) Darwin Online (<http://darwin-online.org.uk/>).

\* See 'Kosmos,' February, 1879, p. 393.

When Göthe, in the year 1786, penetrated by the thought that a common organization must bind together the higher animals, demonstrated the existence of the intermaxillary bone in man, the supposed absence of which had been regarded as a character clearly separating man from animals, no anatomist would agree with him; his idea of vegetable metamorphosis, which he brought forth about the same time, was strenuously opposed by the botanists; and his discovery in 1790 of the vertebral nature of the skull has only met with justice in our own days. Exactly similar was the fate of Dr. Darwin, who, as we shall show, was far in advance of his age. Exceedingly successful in grasping and combining separated things, Göthe absolutely detested the analytical activity of the exact investigator, although he availed himself of it, and indeed exercised it himself in procuring the materials for his new conception of the world. Dr. Darwin had no such aversion to the analytical activity of the philosophers and specialists, and hence he carried his construction further than any of his predecessors and contemporaries. The similarity of the conceptions

of the universe of the two poets is in many respects as great as their need to give utterance to them in verse; but this agreement may be easily explained if we consider that both of them started from the investigations of the same precursors, Buffon and Linnæus.

The first great work of Darwin, the didactic poem 'The Botanic Garden,' is divided into two parts, which are not very closely connected; for this reason I shall hereafter cite the second part, 'The Loves of the Plants,' which appeared before the first, under the above special title.\* The first part, 'The Economy of Vegetation,' certainly answers to both the principal and special titles only in its last canto, the first three cantos describing the action of the forces of nature in general, and specially the formation of the world. Various critics have expressed the opinion that Dr. Darwin's didactic poem was an imitation of one which appeared anonymously in London in 1735 under the title of 'Universal Beauty,' the author of which afterwards turned out to

\* The following citations refer throughout to the second editions, both of the first part ('The Economy of Vegetation,' London, Johnson, 1791) and of the second ('The Loves of the Plants,' London, Nichols, 1790).

be the poet Henry Brooke. Others have represented Sir Richard Blackmore's poem, 'The Creation,' which appeared in 1712, as the model.\* Neither statement has the slightest foundation. Henry Brooke's 'Universal Beauty' is a "Physico-theology" in verse, which, although decidedly more sonorous and poetical than the offspring of the similarly employed muse of his German namesake (Heinrich Brookes), is merely devoted to a representation of the glories of creation of the same character as the physico-theologies of that period. Blackmore's 'Creation,' which, from its being divided into seven books, people have been led to regard as belonging to the Diluvianistic literature, treats of the process of creation only by the way; and is essentially a purely polemico-rhetorical philippic against the atheists, from Democritus and Epicurus down to Descartes and Spinoza, in which we find so little sound judgment and insight that the author can by no means make up his mind

\* The suggestion that Dr. Darwin may have made use of Brooke's 'Universal Beauty' as his pattern, seems to have first appeared in a critical article in the 'Edinburgh Review' (April, 1803, 4th ed. p. 491), but has since passed, as a demonstrated fact, into later biographical works, *e.g.*, the 'Biographie Universelle.'

whether he shall decide in favour of Aristotle and Ptolemy, or of Copernicus, Kepler, and Newton. The German critics who regard Blackmore's poem as the model of Darwin's 'Botanic Garden' must certainly have neglected to read at least one of these didactic poems. Blackmore's work might much rather be regarded as the pattern for Polignac's 'Anti Lucretium,' although it is far exceeded by the latter in dialectic acuteness.

In the introduction and apology to the 'Botanic Garden' the author says: "The general design of the following sheets is to enlist Imagination under the banner of Science; and to lead her votaries from the looser analogies which dress out the imagery of poetry, to the stricter ones, which form the ratiocination of philosophy. . . . It may be proper here to apologize for many of the subsequent conjectures on some articles of natural philosophy, as not being supported by accurate investigation or conclusive experiments. Extravagant theories, however, in those parts of philosophy, where our knowledge is yet imperfect, are not without their use; as they encourage the

“execution of laborious experiments, or the  
“investigation of ingenious deductions, to  
“confirm or refute them.”)

The plan of the poem was to a certain extent prescribed by those initial verses of Miss Seward's, which the author placed at the commencement of his work, either out of gallantry or in acknowledgment of their having given the first inducement to the production of the poem. Starting from the fundamental idea that the mythology of the ancients glorified the forces and government of nature in the persons of their deities, he has introduced the personified forces of nature which prevail in fire, air, water, and earth; and then represents the goddess as addressing herself to the different groups of elementary spirits, in a figurative discourse, permeated throughout with mythological elements, and describing the part taken by each in the formation and life of the world. Thus the first canto is addressed to the “nymphs of primeval fire,” and he accordingly describes the production of the universe from this source, at the same time bringing together many of the ordinary phenomenal forms of

fire, heat, and light. Matters which can only be slightly touched upon in the verses are further elaborated, partly in short footnotes and partly in more detailed memoirs (additional notes) which are relegated to the end of the volume. It is to these notes that our attention must principally be directed.

We are especially interested in a note to verse 101 of the first canto, in which the author unfolds the idea and the first scheme of the theory of evolution. He says: “From  
“having observed the gradual evolution of the  
“young animal or plant from its egg or seed;  
“and afterwards its successive advances to its  
“more perfect state, or maturity; philosophers  
“of all ages seem to have imagined that the  
“great world itself had likewise its infancy and  
“its gradual progress to maturity; this seems  
“to have given origin to the very antient  
“and sublime allegory of Eros, or Divine love,  
“producing the world from the egg of Night,  
“as it floated in chaos.” To the second particularly important part of this note we shall have to refer hereafter.

For the student of the history of civilization who looks back from a Darwinistic standpoint,

a fancy worked out in this canto as to the discovery and subjugation of fire, which Darwin denominates "the first art," will be particularly interesting.

"Nymphs! your soft smiles uncultur'd man subdued,  
And charm'd the Savage from his native wood;  
You, while amaz'd his hurrying Hords retire  
From the fell havoc of devouring Fire,  
Taught, the first Art! with piny rods to raise  
By quick attrition the domestic blaze,  
Fan with soft breath, with kindling leaves provide,  
And list the dread Destroyer on his side.  
So, with bright wreath of serpent-tresses crown'd,  
Severe in beauty, young Medusa frown'd;  
Erewhile subdued, round Wisdom's Ægis roll'd,  
Hiss'd the dread snakes, and flam'd in burnish'd gold;  
Flash'd on her brandish'd arm the immortal shield,  
And Terror lighten'd o'er the dazzled field."\*

We then have the well-known verses on the power of steam, vv. 289-296.

"Soon shall thy arm, Unconquer'd Steam, afar  
Drag the slow barge, or drive the rapid car;  
Or on wide-waving wings expanded bear  
The flying-chariot through the fields of air.  
— Fair crews, triumphant, leaning from above,  
Shall wave their flutt'ring kerchiefs as they move;  
Or warrior-bands alarm the gaping crowd,  
And armies shrink beneath the shadowy cloud.

\* 'Economy of Vegetation,' canto i. vv. 209-222.

So mighty Hercules o'er many a clime  
Waved his vast mace in Virtue's cause sublime,  
Unmeasured strength with early art combined,  
Awed, served, protected, and amazed mankind."

The second canto is addressed to the gnomes or earth-spirits, and describes the gradual development of the earth, which, with the other planets, the author believes to have been cast forth from a volcano in the sun. By stronger friction or adhesion to one wall of this volcano the earth received its axial revolution and spheroidal form; by refrigeration a nucleus was formed, upon which the waters were precipitated as a primeval ocean free from salt, while the lighter gases formed the atmosphere. "It is probable," he adds, "that all the calcareous earth in the world . . . . was formed originally by animal and vegetable bodies from the mass of water."\* By the lixiviation of the rocks the seas became salt. Finally the formation of the vegetable

\* It was a favourite notion of Dr. Darwin's that all the lime of the earth originated from living creatures, corals, shells, and other animals, and therefore must have taken part in the pleasures and pains of life. The limestone mountains of England appeared to him as "mighty monuments of past delight." It was probably in consequence of this idea, and in allusion to his family arms, consisting of three scallop shells, that he altered his motto to "E conchis omnia."

world is indicated, to which may be added here from the second part (pp. 36 and 44) that Darwin regarded lichens as the oldest terrestrial plants, and, like Hæckel in more recent times, he referred the fungi to a kingdom which, like "a narrow isthmus," united plants and animals.

In the third canto, addressed to the water-nymphs, the circulation and action of water upon the earth is described. The formation of clouds, the sea and its life, springs, rivers, geysers, glaciers, coral structures, &c. In this connection the fossil marine animals also come under discussion; and after mentioning the singular circumstance that most fossil marine animals as, for example, the ammonites, are no longer found living, whilst the living animals do not occur in the fossil state, the author raises the questions, "Were all the ammoniæ destroyed when the continents were raised? Or do some genera of animals perish by the increasing power of their enemies? Or do they still reside at inaccessible depths in the sea? Or do some animals change their forms gradually and become new genera?"\*

\* 'The Economy of Vegetation,' p. 120.

The question of the transformation of species and their development into higher forms was a favourite one with the elder Darwin, and one to which he has given expression in all his works, at least in one place, and usually in very similar terms. Already, in the eighth page of the poem now under consideration, he brings it forward, and after having spoken of the stratified formation of the earth in a note, the commencement of which has already been given, he says: "There are likewise some apparently useless or incomplete appendages to plants and animals which seem to shew they have gradually undergone changes from their original state; such as the stamens without anthers, and styles without stigmas of several plants, as mentioned in the note on Curcuma, vol. ii. of this work. Such as the halteres, or rudiments of wings of some two-winged insects, and the paps of male animals; thus swine have four toes, but two of them are imperfectly formed, and not long enough for use." We here break off in order to append the above-mentioned note on the Turmeric

plant, which gives the theory of rudimentary organs still more completely. "There is a curious circumstance," he says, "belonging to the class of insects which have two wings, or diptera, analogous to the rudiments of stamens above described; viz. two little knobs are found placed each on a stalk or peduncle, generally under a little arched scale; which appear to be rudiments of hinder wings; and are called by Linneus halteres, or poisers, a term of his introduction. Other animals have marks of having in a long process of time undergone changes in some parts of their bodies, which may have been effected to accommodate them to new ways of procuring their food. The existence of teats on the breasts of male animals, and which are generally replete with a thin kind of milk at their nativity, is a wonderful instance of this kind. Perhaps all the productions of nature are in their progress to greater perfection?—an idea countenanced by the modern discoveries and deductions concerning the progressive formation of the solid parts of the ter-

"raqueous globe, and consonant to the dignity of the Creator of all things."\*

Buffon before him had regarded the rudimentary organs somewhat in the same way, but he had by no means perceived with equal clearness their part as evidence in favour of the theory of descent. The pig, says Buffon, rather mysteriously, "does not appear to have been formed upon an original, special and perfect plan, since it is a compound of other animals; it has evidently useless parts, or rather parts of which it cannot make any use,—toes, all the bones of which are perfectly formed, and which nevertheless are of no service to it. Nature is consequently far from subjecting herself to final causes in the formation of her creatures. Why should she not sometimes add superfluous parts, when she so often seems to omit essential ones? . . . . Why do we regard it as necessary that in each individual every part should be useful to the others and necessary to the whole? Does it not suffice for their co-existence that they do not injure one another, that they

\* 'Loves of the Plants,' pp. 7, 8.

“ can grow without hindrance, and develop  
 “ without obliterating each other? All parts  
 “ which do not sufficiently injure one another  
 “ to cause mutual destruction, all that can  
 “ exist together, exist; and perhaps in the  
 “ majority of living creatures there are fewer  
 “ related, useful or necessary, than indifferent,  
 “ useless or superfluous parts. But we, always  
 “ wishing to refer everything to a certain  
 “ purpose, when parts have no apparent use,  
 “ invent for them hidden purposes and  
 “ imagine unfounded relations which do not  
 “ exist in the nature of things, and only serve  
 “ to obscure matters. We fail to see that  
 “ thus we deprive philosophy of its true  
 “ character, and misrepresent its object, which  
 “ consists in the knowledge of the ‘How’ of  
 “ things, the way in which nature acts, and  
 “ that we substitute for this real object a vain  
 “ idea by seeking to divine the ‘Why’ of  
 “ the facts, or the purpose which she has in  
 “ her activity.”\*

Buffon had a dim idea that rudimentary organs and similar irregularities found their explanation in the consideration of the general

\* ‘Hist. Nat.’ tome v. 1755, pp. 103, 104.

connection of natural objects; he indicated  
 that doubtful species, irregular structures, and  
 anomalous existences found their place in the  
 eternal order of things, as well as all others,  
 and that they complete the links of the chain;  
 but he has not expressed his opinion upon  
 these points with any distinctness, like Dr.  
 Darwin. The chief force of the above words  
 is evidently directed against the physico-  
 theologians.

The last century was a period of the most  
 industrious and endless search after design.  
 In opposition to the French philosophy,  
 with its materialistic tendency, innumerable  
 hosts of pious writers came forward in Eng-  
 land, Holland, and especially in Germany,  
 and undertook to prove the divine origin  
 of all things from the study of nature itself,  
 and indeed, from every straw and sand-  
 grain. Following on the two best works of  
 this kind, namely, Swammerdamm’s ‘*Biblia  
 Naturæ*,’ and John Ray’s ‘*The Wisdom of  
 God Manifested in Creation*’ (1691), there  
 poured forth upon the people such a flood  
 of writings upon natural theology that a  
 book would be required to give a toler-

able review only of the chief of them:— Nehemiah Grew's 'Cosmologia Sacra' (1711), and Derham's 'Astro-, Physico-, Hydro-' and 'Pyro-theology' were occupied more with general questions, but in Germany, on this field favoured by the Leibnitz-Wolfian philosophy, the minutest details were gone into. A shallow, sickly enthusiasm, which was called "natural religion," gained the upper hand; the whole world appeared only to exist for the service, pleasure and edification of man. Lesser's 'Litho-theologie' (1735) and Rohr's 'Phyto-theologie' (1739) were followed, going more into detail, by Lesser's 'Insecto-theologie' (1738), and the same learned pastor's 'Testaceo-theologie,' Zorn's 'Petino-theologie' (1742) and two 'Ichthyo-theologies' by Malm and Richter (1751 and 1752). Gradually even the individual species of animals took their turn, e.g., the bees in Schierach's 'Melitto-theologie' (1767); nay, even such natural phenomena of very doubtful benefit as swarms of locusts and earthquakes were rendered harmless in Rathleff's voluminous 'Acrido-theologie' (1748) and Pren's 'Sismo-theologie' (1772). That Hein-

sius celebrated "Snow as an admirable creature of God" in his 'Chiono-theologie' (1735), and Ahlwardt did the same good service to thunder and lightning in his 'Bronto-theologie' (1745) was only right and proper.

Buffon could not escape from this tendency of his time, and in the first volume of his 'Natural History' he devoted a long justificatory chapter to the mountains which Burnet had charged with being evidences of the Fall of Man. Feuerlin, however, had preceded him with a Latin Dissertation on the mountains as divine witnesses (1729) in opposition to Lucretius and Burnet.\*

Against this movement, to which Brooke's poem already mentioned also pertains, the elder Darwin opposed himself, not indeed expressly, but for that very reason the more efficaciously. He did not inquire how far this or that property of plants or animals was directly or indirectly serviceable to man, but rather whether particular properties

\* This enumeration of physico-theological writings is derived from the elaborate work of G. Zöckler, 'Geschichte der Beziehungen zwischen Theologie und Naturwissenschaft,' Gütersloh, 1877-79.

were not useful to the organisms themselves, and whether it was conceivable that they could have acquired such properties as favoured their well-being by an internal impulse and gradual improvement. For a time he seems to have addressed to every creature that came before him, some such apparently curious questions as these: Why does any creature have this and no other appearance? Why has this plant poisonous juices? Why has that one spines? Why have birds and fishes light-coloured breasts and dark backs? &c., &c. The last canto of the first part of the 'Botanic Garden,' and the second part generally, are particularly rich in such justly-raised and truly Darwinistic questions. We shall have to recur to this point hereafter, and now, after this digression, return once more to the analysis of the 'Botanic Garden.'

In the fourth canto, addressed to the sylphs, after some descriptions of winds and climates, the author turns to the daughters of the air, the plants, and describes their economy, in the course of which a great number of exceedingly modern remarks are

anticipated. In a note to verse 411 (p. 194) the digestion of the reserve material in the seed-lobes during germination is described as a process perfectly analogous to animal digestion, and for some years we have been aware that this comparison is justified even in its details; but above all, in the second part, in which plants are arranged in accordance with the sexual system, and their several relations especially described in separate pictures, that theme of the protection of plants from unbidden guests, which Kerner three years ago made the subject of an interesting book,\* is referred to.

Here we learn in the first place that the waxy and resinous secretions of the green parts serve as protections against cold and moisture; and that essential oils, strong odours, and poisons are useful to plants, by protecting them from marauding insects and other animals. The root of the meadow saffron (*Colchicum autumnale*), which does not ripen its seeds until the following spring, would be in danger of destruction in winter

\* 'Die Schutzmittel der Blüten gegen unberufene Gäste. Vienna, 1876.

by animals living in the ground, if it did not contain so acrid a poison.\* This example of a poisonous bulb is particularly instructive, because here, in consequence of the seeds ripening only in the next period of vegetation, the existence of the plant in winter would be seriously compromised if the bulb were edible.

The holly (*Ilex aquifolium*) led Dr. Darwin to specially thoughtful considerations in this direction; he speaks of it as follows:† “Many plants, like many animals, are furnished with arms for their protection; these are either aculei, prickles, as in rose and barberry, which are formed from the outer bark of the plant; or spinæ, thorns, as in hawthorn, which are an elongation of the wood, and hence more difficult to be torn off than the former; or stimuli, stings, as in the nettles, which are armed with a venomous fluid for the annoyance of naked animals. The shrubs and trees, which have prickles or thorns, are grateful food to many animals, as goosberry and gorse; and

\* ‘The Loves of the Plants,’ p. 22, note.

† *Ibid.* pp. 18, 19, note.

“would be quickly devoured, if not thus  
“armed; the stings seem a protection against  
“some kinds of insects, as well as the naked  
“mouths of quadrupeds. Many plants lose  
“their thorns by cultivation, as wild animals  
“lose their ferocity, and some of them their  
“horns. A curious circumstance attends the  
“large hollies in Needwood Forest; they are  
“armed with thorny leaves about eight feet  
“high, and have smooth leaves above; as if  
“they were conscious that horses and cattle  
“could not reach their upper branches.”

On the other hand, that the plants thus armed furnish animals with an especially dainty food is proved by the fondness of the ass for thistles, and of the horse for furze, of which the author gives an instructive example in a book which will be noticed hereafter. He says: “In the extensive moorlands of Staffordshire the horses have learnt to stamp upon a gorse-bush with one of their fore-feet for a minute together, and when the points are broken, they eat it without injury; which is an art other horses in the fertile parts of the country do not

“possess, and prick their mouths till they bleed, if they are induced by hunger or caprice to attempt eating gorse.”\*

This observer of nature was particularly interested in the means possessed by plants for preventing the crawling up of wingless insects into the flowers. He explained in this way the small water-basins which the leaves form about the stem of the Fuller's Teasel, and which have recently led to a remarkable investigation on the part of one of his descendants,† as also the larger basins which surround the flower stalks of the Bromeliaceæ, as being arrangements destined partly to the refreshment of the plants, and partly to serve as a protection for its flowers and seeds.‡ A similar protective contrivance occurs most instructively in the viscous rings of the catchfly, the description of which may follow here as a sample of the ‘Loves of the Plants,’ with the preliminary remark that the numbers relate to the stamens and

\* ‘Zoonomia,’ vol. i. p. 162, sect. xvi. ii.

† See ‘Kosmos,’ i. p. 354.

‡ ‘The Loves of the Plants,’ p. 37.

styles in each of these individual descriptions.

“The fell Silene and her sisters fair,  
Skill'd in destruction, spread the viscous snare.  
The harlot-band *ten* lofty bravo's screen,  
And frowning guard the magic nets, unseen.  
Haste, glittering nations, tenants of the air,  
Oh, steer from hence your viewless course afar!  
If with soft words, sweet blushes, nods, and smiles,  
The *three* dread Syrens lure you to their toils,  
Limed by their art in vain you point your stings,  
In vain the efforts of your whirring wings!—  
Go, seek your gilded mates and infant hives,  
Nor taste the honey purchas'd with your lives!”

In a note upon this passage of his poem (pp. 15, 16) Darwin remarks: “The viscous material which surrounds the stalks under the flowers of this plant, and of the *Cucubalus Otites*, is a curious contrivance to prevent various insects from plundering the honey, or devouring the seed. In the *Dionæa Muscipula* there is a still more wonderful contrivance to prevent the depredations of insects; the leaves are armed with long teeth, like the antennæ of insects, and lie spread upon the ground round the stem; and are so irritable, that when an insect creeps upon them, they fold up, and crush

“or pierce it to death.” The same explanation is satisfactory to him for the capture of insects by the leaves of the Sundew (*Drosera*), at the same time, that both plants had been already suspected of using the captured insects as food. Diderot, it may be remarked in passing, appears to have been the first to employ the expression “carnivorous plants;” he said of the Venus’ fly-trap (*Dionæa*), “Voilà une plante presque carnivore.”\*

We must dwell a little longer upon the investigations of the elder Darwin upon the protective arrangements of plants, because they explain to us a remarkable error into which this acute naturalist fell with respect to the secretion of honey in flowers. He believed, especially from the last-mentioned examples, that plants were generally equipped so as to keep insects and other lovers of honey away from the flowers; and he was strengthened in this opinion by the circumstance that the source of honey in most flowers is very much concealed, and often hidden under complex protective contrivances. He also thought that the resemblance

\* Diderot, Œuvres, ed. d’Assézat, tome xi. p. 227.

of the flowers of many orchids to insects could be best explained by a sort of mimicry. His idea, which was very ingenious although fallacious, was that they had acquired the aspect of flowers already occupied by insects in order to be protected from the visits of lovers of honey. Thus the flowers of the Fly-Ophrys resemble a small wall-bee (*Apis ichneumonea*) so closely that at a small distance they appear to be already occupied; and a South-American *Cypripedium* even resembles the bird-catching spider, in order to frighten away the humming birds, which are so greedy of honey.\* Although founded on false examples, the principle of mimicry is here quite correctly expounded, and perhaps for the first time.

The works of Kölreuter † (1761) and Sprengel (1793), which explained the contrivances for the allurements of insects, appear to have been unknown to Darwin, or to have been regarded by him as unconvincing, for even in

\* ‘The Economy of Vegetation,’ p. 201.

† Dr. Darwin certainly mentions casually the experiments on *Nicotiana*, by which Kölreuter thought that he had succeeded in converting one plant into another, but he only knew of them from another book.

his last (posthumous) work, 'The Temple of Nature,' he speaks of the honey-secretion of plants in the same way as in his earliest writings. In a special article,\* he endeavours to fathom the secret cause of the general and abundant secretion of honey by most flowers, and arrives at the supposition that it is intended to serve as nutriment and as an excitant for the sexual organs of the plant, for which reason it flows only until fertilization has taken place. He was strengthened in this curious error by the circumstance that insects usually go in search of honey in no other stage of their development than at the period of their sexual maturity, that is to say, as perfect insects. A "philosopher" who seems to have accompanied him upon this mistaken course, actually supported his opinion by the absurd conjecture that the first insects had proceeded from a metamorphosis of the honey-loving stamens and pistils of the flowers, by their separation from the parent plant after the fashion of the male flowers of *Vallisneria*, and "that many

\* 'The Economy of Vegetation,' Additional Notes, pp. 107-112.

" other insects have gradually in long process  
 " of time been formed from these; some  
 " acquiring wings, others fins, and others  
 " claws, from their ceaseless efforts to procure  
 " their food, or to secure themselves from injury.  
 " He (the philosophic friend) contends that  
 " none of these changes are more incompre-  
 " hensible than the transformation of tadpoles  
 " into frogs, and caterpillars into butter-  
 " flies." \*

This error is so instructive and worth notice, because it shows us the difficulty of explaining a complex natural arrangement, when one starts from false premises. Could Dr. Darwin, who afterwards wrote so impressively upon the mischief of inbreeding, have heard from any one the magic words "Benefits of Cross-fertilization," his error would have fallen like scales from his eyes; but he firmly believed that flowers are as far as possible adapted for self-fertilization, and he stigmatizes a case of fertilization by the stamens of other flowers, observed by chance in *Collinsonia*, with the name of "adultery." † At the same

\* 'The Economy of Vegetation,' Additional Notes, p. 109.

† 'The Economy of Vegetation,' p. 197, note.

time the exact adaptation of the honey-seeking insects to their business did not escape him, for in one passage, after describing the great care which Nature has taken to hide the honey of the honeysuckle at the bottom of a long tube (in contrast, incomprehensible to him, with those flowers in which it lies quite exposed), he adds that the proboscis of bees and lepidoptera seems to be especially designed to reach it in spite of these precautions. "The colouring materials of vegetables, like those which serve the purpose of tanning, varnishing, and the various medical purposes, do not seem," he says in a note on the madder plant,\* "essential to the life of the plant; but seem given it as a defence against insects or other animals, to whom these materials are nauseous or deleterious. The colours of insects and many smaller animals contribute to conceal them from the larger ones which prey upon them. Caterpillars which feed on leaves are generally green; earth-worms the colour of the earth which they inhabit; butterflies, which frequent flowers, are coloured like them; small

\* 'The Loves of the Plants,' p. 38, note.

"birds which frequent hedges have greenish backs like the leaves, and light coloured bellies like the sky, and are hence less visible to the hawk, who passes under them or over them. Those birds which are much amongst flowers, as the goldfinch (*Fringilla carduelis*), are furnished with vivid colours. The lark, partridge, hare, are the colour of dry vegetables or earth on which they rest. And frogs vary their colour with the mud of the streams which they frequent; and those which live on trees are green. Fish, which are generally suspended in water, and swallows, which are generally suspended in air have their backs the colour of the distant ground, and their bellies of the sky. In the colder climates many of these become white during the existence of the snows. Hence there is apparent design in the colours of animals, whilst those of vegetables seem consequent to the other properties of the materials which possess them."\*

\* In the numerous works of the last century which treat of physico-theology, and especially in those on insecto-theology, in which the existence of a purpose in all the arrangements of Nature was discussed in all senses, there are probably numerous examples of phenomena pertaining to "mimicry." Thus Rösel

In his chief scientific work, the 'Zoonomia,'\* to which we now turn, Darwin has also sought to fathom the causes at work in these colorations, a matter to which we shall revert hereafter. The work just mentioned essentially forms a physiology and psychology of man as a foundation for a pathology, but at the same time glances are everywhere cast over the whole animal world. What rank this work may take in the history of physiology, psychology, and medicine, I cannot judge, from want of special knowledge in those departments. Upon the author's contemporaries it produced a very considerable impression, and was immediately translated into German by a physician of note,† and the translator points out the wonderful agreement of its views with those of a simultaneously published work of the celebrated German pathologist

---

von Rosenhof, in his 'Insekten-Belustigungen' (Nürnberg, 1746), describes the resemblance which the caterpillars of geometric moths, and also certain moths when in repose, present to dry twigs, and thus conceal themselves, but this group of biological phenomena seems to have been first regarded from a more general point of view by Dr. Darwin.

\* 'Zoonomia, or the Laws of Organic Life.' London, 1794-1798.

† By Hofrath J. D. Brandis, in 5 vols. Hanover, 1795-1799.

Reil; Hufeland also was strongly influenced by Darwin. The fundamental idea, it seems to me, is that in plants and animals a living force is at work, which, endowed in both with sensibility, is enabled *spontaneously* to adapt them to the circumstances of the outer world, so that the assumption of innate ideas, of divinely implanted impulses and instincts is rendered unnecessary, and even the process of thought appears attainable as the legitimate activity of a mechanical analysis and combination. All kinds of human knowledge originate from the senses, the action of which is regarded as the chief source of knowledge, and is accordingly first of all investigated.

As regards the apparently inborn faculties which young animals bring with them into the world, the author explains them by repeated exertions of the muscles under the guidance of the sensations and stimuli. Thus it cannot be wonderful that animals are born into the world with the faculty of swimming, or of walking upon four feet, and of swallowing, for they learnt to swim in the egg or in the body of the mother, whilst to walk upon two feet is for quadrupeds an art which does not

belong to nature; the swallowing of fluids is learnt by every foetus, for they all swallow the amniotic fluid that surrounds them, and it is only the eating of solid matter that requires to be afterwards learned. In the learning of new things the imitative impulse has most to do; and the fact that man, as Aristotle has said, is above all an imitative animal, fits him best for the acquisition of difficult performances,—as, for example, of speech. The author ascribes this desire of imitation even to the smallest constructive parts of the body (as we should say, to the cells), and thereby explains the simultaneous disease of whole complexes of them. The expression of the emotions, also, is acquired by imitation, although their fundamental conditions are organically imposed.

The author very carefully studied this subject, which has been elaborated by his grandson with so much success, and deduces his formulæ especially from the *first* impressions of new-born creatures. The trembling of fear may perhaps be referred back to the cold shivering of the new-born infant; and weeping to the first irritation of

the lachrymal glands by cold air, as well as by pleasant and disagreeable odours. That anger and rage are universally expressed by animals taking the position of attack, is immediately intelligible. As regards smiling and the expression of the agreeable sensations, the author refers them, as well as the feeling of the beauty of undulating lines and of rounded surfaces, to the pleasure of the first nourishment derived from the soft and gently rounded maternal breast. “In the action of sucking,” he says, “the lips of the infant are closed around the nipple of its mother, till he has filled his stomach, and the pleasure occasioned by the stimulus of this grateful food succeeds. Then the sphincter of the mouth, fatigued by the continued action of sucking, is relaxed; and the antagonist muscles of the face gently acting, produce the smile of pleasure, as cannot but be seen by all who are conversant with children. Hence this smile during our lives is associated with gentle pleasure; it is visible in kittens, and puppies, when they are played with and tickled; but more particularly marks the human features.

“ For in children this expression of pleasure  
 “ is much encouraged, by their imitation of  
 “ their parents, or friends, who generally  
 “ address them with a smiling countenance:  
 “ and hence some nations are more remark-  
 “ able for the gaiety, and others for the  
 “ gravity of their looks.”\*

Similarly the wagging of the tails of animals and the purring of cats are referred back to certain movements which they acquire in the time of their existence as sucklings. “ Lambs shake or wriggle their tails, at the  
 “ time when they first suck, to get free of  
 “ the hard excrement which had been long  
 “ lodged in the bowels. Hence this becomes  
 “ afterwards a mark of pleasure in them, and  
 “ in dogs, and other tailed animals. But  
 “ cats gently extend and contract their paws  
 “ when they are pleased, and purr by draw-  
 “ ing in their breath, both which resemble  
 “ their manner of sucking, and thus become  
 “ their language of pleasure, for these animals  
 “ having collar-bones, use their paws like  
 “ hands when they suck, which dogs and  
 “ sheep do not.”† These examples may

\* ‘Zoonomia,’ vol. i. xvi. 8, 4.

† *Ib.* 8, 3.

serve to show the author’s treatment of this difficult theme.

The arts and migratory and social instincts of animals are referred to personal consideration and gradual experience of advantages to be attained. Here also the imitative impulse plays a principal part; and if a horse, for example, wishes to be scratched in a particular part which he cannot reach with his muzzle, he bites his neighbour in the spot in question, and the latter at once understands the hint and does what is required of him. That the arts of animals are acquired is proved by the example already adduced of certain horses stamping down the spiny furze, which the horses of more fertile districts do not understand; and the author also cites many other instances of local deviations and innovations in nest-building and the construction of burrows. Here also we find already mentioned those statements which have been frequently made of late years, with regard to bees which, in certain distant countries (in this case the Island of Barbadoes), store up no honey. The author regards the artificial skill of bees and

ants as very ancient, seeing that it has become so perfectly developed.

It must not, however, be supposed that the author regards these instincts as communicated solely by imitation; he accepts without hesitation the heritability of acquired corporeal peculiarities and mental faculties. Upon these points there is, in the section (xxxix.) which treats of generation, and is of the greatest importance to us, an introductory observation which contains, as in a nutshell, the explanation of the biological fundamental law, and expresses the same ideas which Mr. Samuel Butler last year made the subject of a comprehensive book.\* “The ingenious Dr. Hartley in his work on man, and some other philosophers,” says Darwin, “have been of opinion, that our immortal part acquires during this life certain habits of action or of sentiment, which become forever indissoluble, continuing after death in a future state of existence; and add, that if these habits are of the malevolent kind, they must render the possessor miserable even in heaven. *I would apply this ingenious*

\* ‘Life and Habit.’ London, 1878.

“idea to the generation, or production of the embryo, or new animal which partakes so much of the form and propensities of the parent.” And he continues as follows: “Owing to the imperfection of language the offspring is termed a *new* animal, but is in truth a branch or elongation of the parent; since a part of the embryo-animal is, or was, a part of the parent; and therefore in strict language it cannot be said to be entirely *new* at the time of its production; and therefore it may retain some of the habits of the parent-system.”\*

It may be observed that the author speaks here only of one parent; this is because he supposed that the embryo consists of the spermatozoid produced by the father, which in the mother finds little more than a suitable nutritive fluid, and a nidus in which it can develop itself into a perfect animal. The resemblance of the newly produced creature to the mother may be explained by the influence of the nutritive material furnished by her. Leaving out of consideration this easily excusable, and, in itself, unimportant error

\* ‘Zoonomia,’ xxxix. 1.

(which I was obliged to mention only because the author always speaks of a "filament," instead of the egg as the germ of the living creature), the author now, with the greatest acumen, maintains the theory of epigenesis in opposition to the theory of evolution (in the older sense), showing that every creature is a complete new formation, which, with each grade of development attained by it, develops other formative impulses, and thus can incorporate with its own essence even the latest acquisitions of its parents, by virtue of the faculty of recollection possessed by the embryo. The old theory of enclosure could not explain such innovations in the domain of life, and against it Dr. Darwin therefore turned with lively sarcasm. "Many ingenious philosophers," he says, "have found so great difficulty in conceiving the manner of the reproduction of animals, that they have supposed all the numerous progeny to have existed in miniature in the animal originally created; and that these infinitely minute forms are only evolved or distended, as the embryo increases in the womb. This idea, besides its being unsupported by any analogy we are

"acquainted with, ascribes a greater tenuity to organized matter than we can readily admit; as these included embryos are supposed each of them to consist of the various and complicate parts of animal bodies: they must possess a much greater degree of minuteness, than that which was ascribed to the devils that tempted St. Anthony; of whom 20,000 were said to be able to dance a saraband on the point of the finest needle without incommoding each other." \*

In the eighth paragraph of the fourth part of this same section the author gives a short sketch of the theory of evolution, which, however, must have been more clearly developed in his mind. I reproduce it here, with some abridgments, because in it, fifteen years before the appearance of Lamarck's 'Philosophie Zoologique,' the principles of evolution were completely set forth. Darwin says, "When we revolve in our minds, first, the great changes, which we see naturally produced in animals after their nativity, as in the production of the butterfly with painted

\* 'Zconomia,' vol. i. § xxxix. iii. 1.

“ wings from the crawling caterpillar; or of  
 “ the respiring frog from the subnatant tad-  
 “ pole; from the feminine boy to the bearded  
 “ man . . . . .

“ Secondly, when we think over the great  
 “ changes introduced into various animals by  
 “ artificial or accidental cultivation, as in  
 “ horses, which we have exercised for the  
 “ different purposes of strength or swiftness,  
 “ in carrying burthens or in running races;  
 “ or in dogs, which have been cultivated for  
 “ strength and courage, as the bull-dog; or  
 “ for acuteness of his sense of smell, as the  
 “ hound and spaniel; or for the swiftness of his  
 “ foot as the greyhound; or for his swimming  
 “ in the water, or for drawing snow-sledges,  
 “ the rough-haired dogs of the north; . . . . .  
 “ and add to these the great changes of shape  
 “ and colour, which we daily see produced in  
 “ smaller animals from our domestication of  
 “ them, as rabbits, or pigeons; or from the  
 “ difference of climates, and even of seasons;  
 “ thus the sheep of warm climates are covered  
 “ with hair instead of wool; and the hares and  
 “ partridges of the latitudes which are long  
 “ buried in snow, become white during the

“ winter months; add to these the various  
 “ changes produced in the forms of mankind  
 “ by their early modes of exertion; or by the  
 “ diseases occasioned by their habits of life;  
 “ both of which become hereditary, and that  
 “ through many generations. Those who  
 “ labour at the anvil, the oar, or the loom, as  
 “ well as those who carry sedan-chairs, or  
 “ those who have been educated to dance  
 “ upon the rope, are distinguishable by the  
 “ shape of their limbs . . . . .

“ Thirdly, when we enumerate the great  
 “ changes produced in the species of animals  
 “ before their nativity; these are such as  
 “ resemble the form or colour of their parents,  
 “ which have been altered by the cultivation  
 “ or accidents above related, and are thus  
 “ continued to their posterity. Or they are  
 “ changes produced by the mixture of species,  
 “ as in mules; or changes produced probably  
 “ by the exuberance of nourishment supplied  
 “ to the fetus, as in monstrous births with  
 “ additional limbs; many of these enormities  
 “ of shape are propagated, and continued as  
 “ a variety at least, if not as a new species

\* of animal. I have seen a breed of cats  
 “ with an additional claw on every foot; of  
 “ poultry also with an additional claw, and  
 “ with wings to their feet; and of others  
 “ without rumps. Mr. Buffon mentions a  
 “ breed of dogs without tails, which are  
 “ common at Rome and at Naples, which he  
 “ supposes to have been produced by a  
 “ custom long established of cutting their  
 “ tails close off. There are many kinds of  
 “ pigeons, admired for their peculiarities,  
 “ which are monsters thus produced and  
 “ propagated. . . . When we consider all  
 “ these changes of animal form, and innumer-  
 “ able others, which may be collected from the  
 “ books of natural history; we cannot but be  
 “ convinced, that the fetus or embryo is  
 “ formed by apposition of new parts, and not  
 “ by the distention of a primordial nest of  
 “ germs included one within another like the  
 “ cups of a conjurer.

“ Fourthly, when we revolve in our minds  
 “ the great similarity of structure which  
 “ obtains in all the warm-blooded animals, as  
 “ well quadrupeds, birds, and amphibious

“ animals, as in mankind; from the mouse  
 “ and bat to the elephant and whale; one is  
 “ led to conclude, that they have alike been  
 “ produced from a similar living filament.  
 “ In some this filament in its advance to  
 “ maturity has acquired hands and fingers,  
 “ with a fine sense of touch, as in mankind.  
 “ In others it has acquired claws or talons  
 “ . . . in others toes with an intervening  
 “ web, or membrane . . . in others it has  
 “ acquired cloven hoofs . . . and whole hoofs  
 “ in others . . . while in the bird kind this  
 “ original living filament has put forth wings  
 “ instead of arms or legs, and feathers instead  
 “ of hair. In some it has protruded horns on  
 “ the forehead instead of teeth in the fore part  
 “ of the upper jaw; in others tusks instead of  
 “ horns; and in others beaks instead of either.  
 “ And all this exactly is daily seen in the  
 “ transmutations of the tadpole, which acquires  
 “ legs and lungs when he wants them; and  
 “ loses his tail when it is no longer of service  
 “ to him.

“ Fifthly, from their first rudiment, or pri-  
 “ mordium, to the termination of their lives,  
 “ all animals undergo perpetual transforma-

“ tions, which are in part produced by their  
 “ own exertions in consequence of their  
 “ desires and aversions, of their pleasures and  
 “ pains, or of irritations, or of associations;  
 “ and many of these acquired forms or  
 “ propensities are transmitted to their pos-  
 “ terity.

X “ As air and water are supplied to animals  
 “ in sufficient profusion, the three great objects  
 “ of desire, which have changed the forms of  
 “ many animals by their exertions to gratify  
 “ them, are those of lust, hunger, and security.  
 “ A great want of one part of the animal  
 “ world has consisted in the desire of the  
 “ exclusive possession of the females; and  
 “ these have acquired weapons to combat  
 “ each other for this purpose, as the very  
 “ thick, shield-like, horny skin on the  
 “ shoulder of the boar is a defence only  
 “ against animals of his own species, who  
 “ strike obliquely upwards, nor are his tusches  
 “ for other purposes, except to defend himself,  
 “ as he is not naturally a carnivorous animal.  
 “ So the horns of the stag are sharp to offend  
 “ his adversary, but are branched for the  
 “ purpose of parrying or receiving the thrusts

“ of horns similar to his own, and have,  
 “ therefore, been formed for the purpose of  
 “ combating other stags for the exclusive  
 “ possession of the females; who are observed,  
 “ like the ladies in the time of chivalry, to  
 “ attend the car of the victor.

“ The birds which do not carry food to their  
 “ young, and do not therefore marry, are  
 “ armed with spurs for the purpose of fight-  
 “ ing for the exclusive possession of the  
 “ females, as cocks and quails. It is certain  
 “ that these weapons are not provided for  
 “ their defence against other adversaries,  
 “ because the females of these species are  
 “ without this armour. *X The final cause of this*  
 “ *contest amongst the males seems to be, that the*  
 “ *strongest and most active animal should pro-*  
 “ *pagate the species, which should thence become*  
 “ *improved.* X

“ Another great want consists in the means  
 “ of procuring food, which has diversified the  
 “ forms of all species of animals. Thus the  
 “ nose of the swine has become hard for the  
 “ purpose of turning up the soil in search of  
 “ insects and of roots. The trunk of the  
 “ elephant is an elongation of the nose for the

“ purpose of pulling down the branches of  
 “ trees for his food, and for taking up water  
 “ without bending his knees. Beasts of prey  
 “ have acquired strong jaws or talons. Cattle  
 “ have acquired a rough tongue and a rough  
 “ palate to pull off the blades of grass. . . .  
 “ Some birds have acquired harder beaks to  
 “ crack nuts, as the parrot. Others have  
 “ acquired beaks adapted to break the harder  
 “ seeds, as sparrows. Others for the softer  
 “ seeds of flowers, or the buds of trees, as the  
 “ finches. Other birds have acquired long  
 “ beaks to penetrate the moister soils in search  
 “ of insects or roots, as woodcocks, and others  
 “ broad ones to filtrate the water of lakes, and  
 “ to retain aquatic insects. *All which seem to*  
 “ *have been gradually produced during many*  
 “ *generations by the perpetual endeavour of the*  
 “ *creatures to supply the want of food, and to*  
 “ *have been delivered to their posterity with*  
 “ *constant improvement of them for the purpose*  
 “ *required.*

“ The third great want among animals is  
 “ that of security, which seems much to have  
 “ diversified the forms of their bodies and the  
 “ colour of them; these consist in the means

“ of escaping other animals more powerful  
 “ than themselves.\* Hence some animals

\* The question here only touched upon is discussed in detail by the author in another part of the ‘Zoonomia’ (§ xxxix, 5, 1) in the following words:—

“ The efficient cause of the various colours of the eggs of birds, and of the hair and feathers of animals, is a subject so curious, that I shall beg to introduce it in this place. The colours of many animals seem adapted to their purposes of concealing themselves, either to avoid danger, or to spring upon their prey. Thus the snake, and wild cat, and leopard, are so coloured as to resemble dark leaves and their lighter interstices; birds resemble the colour of the brown ground, or the green hedges, which they frequent; and moths and butterflies are coloured like the flowers which they rob of their honey . . . . . These colours have, however, in some instances, another use, as in the black diverging area from the eyes of the swan; which, as his eyes are placed less prominent than those of other birds, for the convenience of putting down his head under water, prevents the rays of light from being reflected into his eye, and thus dazzling his sight, both in air and beneath the water; which must have happened, if that surface had been white like the rest of his feathers.

“ There is a still more wonderful thing concerning these colours adapted to the purpose of concealment; which is, that the eggs of birds are so coloured as to resemble the colour of the adjacent objects and their interstices. The eggs of hedge-birds are greenish, with dark spots; those of crows and magpies, which are seen from beneath through wicker nests, are white with dark spots; and those of larks and partridges are russet or brown, like their nests or situations.

“ A thing still more astonishing is, that many animals in countries covered with snow become white in winter, and are said to change their colour again in the warmer months. . . . The final cause of these colours is easily understood, as they serve some purposes of the animal, but the efficient cause would seem almost beyond conjecture.”

The author endeavoured, however, to clear the way towards

“ have acquired wings instead of legs, as the  
 “ smaller birds, for the purpose of escape;  
 “ others great length of fin or of membrane,  
 “ as the flying fish, and the bat. Others great  
 “ swiftness of foot as the hare. Others have  
 “ acquired hard or armed shells, as the tortoise  
 “ and the echinus marinus.

“ The contrivances for the purposes of  
 “ security extend even to vegetables, as is  
 “ seen in the wonderful and various means of

---

an explanation by saying that the impression of the constant white light of the snow, or of the yellow of the desert, or of the green of the woods, might be transferred by reflex action from the retina to the external papillæ of the skin and its coverings; “ and thus, like the fable of the camelion, all animals may possess a tendency to be coloured somewhat like the colours they most frequently inspect, and finally, that colours may be thus given to the egg-shell by the imagination of the female parent.” This supposition has lately been proved to be perfectly correct with respect to certain fishes, amphibia, reptiles, and mollusca, which always suit themselves to their lighter or darker surroundings (see Seidlitz, *Die chromatische Funktion als natürliches Schutzmittel*, in his ‘*Beiträge zur Descendenz-Theorie*.’ Leipzig, 1876); but it does not suffice for the constant colorations, notwithstanding the similar hypotheses put forward by Wallace and others (see *Kosmos*, iv. p. 120), nor did it by any means satisfy the elder Darwin, as appears from his further remarks that the uniformity of the effect would indicate some other general cause, still to be made out. This cause lies in natural selection, and the reticence of the elder Darwin in the face of these circumstances, is the best proof how imperfect any theory of evolution remains without this principle.

“ their concealing or defending their honey  
 “ from insects, and their seeds from birds.  
 “ On the other hand, swiftness of wing has  
 “ been acquired by hawks and swallows to  
 “ pursue their prey; and a proboscis of  
 “ admirable structure has been acquired by  
 “ the bee, the moth, and the humming bird, for  
 “ the purpose of plundering the nectaries of  
 “ flowers. All which seem to have been formed  
 “ by the original living filament, excited into  
 “ action by the necessities of the creatures,  
 “ which possess them, and on which their  
 “ existence depends.

“ From thus meditating on the great  
 “ similarity of the structure of the warm-  
 “ blooded animals, and at the same time of  
 “ the great changes they undergo both before  
 “ and after their nativity; and by considering  
 “ in how minute a portion of time many of  
 “ the changes of animals above described have  
 “ been produced; would it be too bold to  
 “ imagine, that in the great length of time,  
 “ since the earth began to exist, perhaps  
 “ millions of ages before the commencement  
 “ of the history of mankind, would it be too  
 “ bold to imagine, that all warm-blooded

“ animals have arisen from one living filament  
 “ which THE GREAT FIRST CAUSE endued with  
 “ animality, with the power of acquiring new  
 “ parts, attended with new propensities,  
 “ directed by irritations, sensations, volitions,  
 “ and associations; and thus possessing the  
 “ faculty of continuing to improve by its own  
 “ inherent activity, and of delivering down  
 “ those improvements by generation to its  
 “ posterity, world without end!”

It might be doubted, the author goes on to say, whether the fishes, which have fins instead of feet or wings, are of the same blood as the warm-blooded animals; but whales, seals, and above all the frog, which becomes transformed from a fish-like aquatic animal into an aerial quadruped furnished with lungs, show that there is no separation here. On the other hand the insects have evidently proceeded from a different living filament, as also the Linnean class of Vermes, to which sponges, corals, molluscs, &c., were referred. The same must be supposed with regard to plants, which the author, like Göthe, regarded as composite individuals, comparable to coral stocks.

“ Linnæus supposes,” continues Darwin,  
 “ in the Introduction to his ‘Natural Orders,’  
 “ that very few vegetables were at first created,  
 “ and that their numbers were increased by  
 “ their intermarriages, and adds, *suadent hæc*  
 “ *creatoris leges a simplicibus ad composita.*  
 “ Many other changes seem to have arisen in  
 “ them by their perpetual contest for light  
 “ and air above ground, and for food and  
 “ moisture beneath the soil . . . from climate,  
 “ or other causes. From these one might  
 “ be led to imagine, that each plant at first  
 “ consisted of a single bulb or flower to each  
 “ root, as the gentianella and daisy; and that  
 “ in the contest for air and light new buds  
 “ grew on the old decaying flower stem,  
 “ shooting down their elongated roots to the  
 “ ground, and that in process of ages tall  
 “ trees were thus formed, and an individual  
 “ bulb became a swarm of vegetables. Other  
 “ plants, which in this contest for light and  
 “ air were too slender to rise by their own  
 “ strength, learned by degrees to adhere to  
 “ their neighbours, either by putting forth  
 “ roots like the ivy, or by tendrils like the  
 “ vine, or by spiral contortions like the honey-

“suckle; or by growing upon them like the  
 “mistletoe, and taking nourishment from their  
 “barks; or by only lodging or adhering on  
 “them, and deriving nourishment from the  
 “air, as *tillandsia*.\*

“Shall we then say that the vegetable  
 “living filament was originally different from  
 “that of each tribe of animals above-  
 “described? And that the productive living  
 “filament of each of those tribes was different  
 “originally from the other? Or, as the  
 “earth and ocean were probably peopled with  
 “vegetable productions long before the exis-  
 “tence of animals; and many families of  
 “these animals long before other families of  
 “them, shall we conjecture that one and the  
 “same kind of living filaments is and has  
 “been the cause of all organic life?”

[Here the author refers to the supposition  
 that America is perhaps the youngest part of

\* In his multifarious investigations upon the means of diffusion of the seeds of plants, by wind, flying and projectile contrivances, hooks, fur-animals and birds, he mentions with the greatest admiration the seeds of *Tillandsia*, which never germinate on the ground. They are provided on their crown with numerous long filaments, by means of which they fly upon the winds like spiders, until the threads catch upon the branch of a tree, and fix the germ there. ('The Loves of the Plants,' p. 60.)

the world, as its inhabitants have not yet advanced so far in intelligence as those of the Old World, and its animals (*e.g.* alligators and tigers) are smaller and weaker. Moreover, the mountains there are higher and less weathered than ours. That the great lakes of North America are not yet salt, may be explained by their outflow.]

“This idea of the gradual formation and  
 “improvement of the animal world,” he goes  
 on to say, “seems not to have been unknown  
 “to the ancient philosophers. Plato, having  
 “probably observed the reciprocal generation  
 “of inferior animals, as snails and worms,  
 “was of opinion that mankind with all other  
 “animals were originally hermaphrodites  
 “during the infancy of the world, and were  
 “in process of time separated into male and  
 “female. The breasts and teats of all male  
 “quadrupeds, to which no use can be now  
 “assigned, adds perhaps some shadow of  
 “probability to this opinion. Linnæus ex-  
 “cepts the horse from the male quadrupeds,  
 “who have teats; which might have shown  
 “the earlier origin of his existence; but  
 “Mr. J. Hunter asserts, that he has discovered

“ the vestiges of them . . . . and has at the  
 “ same time enriched natural history with a  
 “ very curious fact concerning the male  
 “ pidgeon ; at the time of hatching the eggs  
 “ both the male and female pidgeon undergo a  
 “ great change in their crops, which thicken  
 “ and become corrugated, and secrete a kind  
 “ of milky fluid, which coagulates, and with  
 “ which alone for a few days they feed their  
 “ young, and afterwards feed them with this  
 “ coagulated fluid mixed with other food.  
 “ How this resembles the breasts of female  
 “ quadrupeds after the production of their  
 “ young ! and how extraordinary, that the  
 “ male should at this time give milk as well  
 “ as the female !

“ The late Mr. David Hume, in his posthu-  
 “ mous works, places the powers of genera-  
 “ tion much above those of our boasted  
 “ reason ; and adds, that reason can only  
 “ make a machine, as a clock or a ship, but  
 “ the power of generation makes the maker  
 “ of the machine ; and probably from having  
 “ observed, that the greatest part of the earth  
 “ has been formed out of organic recrements  
 “ . . . . he concludes that the world itself

“ might have been generated rather than  
 “ created ; that is, it might have been pro-  
 “ duced from very small beginnings, increas-  
 “ ing by the activity of its inherent principles,  
 “ rather than by a sudden evolution of the  
 “ whole by the Almighty fiat.—What a mag-  
 “ nificent idea of the infinite power of THE  
 “ GREAT ARCHITECT ! THE CAUSE OF CAUSES !  
 “ PARENT OF PARENTS ! ENS ENTIUM !

“ For if we may compare infinities, it  
 “ would seem to require a greater infinity of  
 “ power to cause the causes of effects, than to  
 “ cause the effects themselves. This idea is  
 “ analogous to the improving excellence  
 “ observable in every part of the creation ;  
 “ such as in the progressive increase of the  
 “ solid or habitable parts of the earth from  
 “ water ; and in the progressive increase of  
 “ the wisdom and happiness of its inhabit-  
 “ ants ; and is consonant to the idea of our  
 “ present situation being a state of probation,  
 “ which by our exertions we may improve,  
 “ and are consequently responsible for our  
 “ actions.”

(c) Darwin Online (<http://darwin-online.org.uk>)  
 No one can avoid admitting that in these  
 considerations, published in 1794, a clear ex-

position is already given of the consequences of the action of use in its application to the theory of descent, and therefore of what is unjustly called Lamarckism. To Lamarck is to be ascribed the great merit of a further elaboration of these ideas, but their true originator and first promulgator appears to have been the elder Darwin. With the most perfect certainty we also at the same time have the principles of a theory of sexual selection laid down, as far as the consequence that the strongest male will preferentially propagate, that is to say, within the same limits in which alone Mantegazza and Wallace are willing to recognise sexual selection. The theory of protective coloration is extended to the eggs of birds, a discovery which has of late frequently been ascribed to Wallace. Moreover it deserves to be indicated that Darwin regards sexual reproduction as a principal condition of the advancement of living creatures, as is also the case with many modern naturalists. It is probable, he says, "that if vegetables could only have been produced by buds and bulbs, and not by sexual generation, that there would not

"at this time have existed one thousandth part of their present number of species; which have probably been originally mule-productions; nor could any kind of improvements or change have happened to them, except by the difference of soil or climate."\*

Dr. Darwin believed, moreover, with the physicians of the last century, that the imagination of the parents being directed to certain definite ideals might exert a beneficial influence upon the young, which would be impossible in asexual propagation. In a similar sense the adherents of Geoffroy's school afterwards thought that the changes of the world and of the surrounding medium must have acted more powerfully upon the plastic embryo than upon the already mature creature.

A few years after the 'Zoonomia,' Darwin published his 'Phytologia,'† in which we also find many coincidences with the investiga-

\* 'Zoonomia,' vol. i. xxxix. 6, 2.

† 'Phytologia; or, the philosophy of agriculture and gardening, with the theory of draining morasses, and with an improved construction of the drill plough.' London, Johnson, 1800. In German by Hebenstreit, 2 vols. Leipzig, 1801.

tions of his grandson, especially with regard to artificial selection. Nevertheless we need not here go into it in detail, as his conception of the vegetable world has already been sufficiently explained in its main features in connection with the 'Botanic Garden' and the 'Zoonomia,' whilst some notice will have to be given to it in the consideration of his last work and the general criticism of his system.

'The Temple of Nature,'\* dated at the Priory, near Derby, on the 1st of January, 1802, was published in the year following the death of the poet in a quarto volume, adorned, like the 'Botanic Garden,' with fine engravings. It is also a didactic poem, a representation in florid verses of his conception of the universe, fully matured during an interval of ten years. In our rapid analysis we can of course only refer to the novel points of the poem.

In the first canto, which deals with the production of life, &c., we find a decided insistance on the hypothesis of a *Generatio*

\* 'The Temple of Nature; or, the Origin of Society.' A Poem. London, 1803. In German by Kraus. Brunswick, 1808, 8vo.

*œquivoca*, the necessity of which he maintains in a note occupying ten quarto pages. In the 'Phytologia' Darwin had set up the hypothesis that the most ancient plants and animals had been destitute of sex, and that the first sexual organs were formed only at a later period. The asexual propagation of many plants and animals, such as the Aphides, which periodically alternates with sexual generation, are reminiscences of this asexual state, and if we then go back still further we arrive necessarily at the hypothesis of spontaneous production:—

"Hence without parent by spontaneous birth  
Rise the first specks of animated earth."

The examples which he adduces as probable occurrences of spontaneous generation at the present day, such as Priestley's green matter, moulds and other fungi, &c., are certainly not very seductive to an unbeliever, but the acceptance of this hypothesis ought now-a-days to meet with fewer difficulties than that of the rival hypothesis of eternal cosmical life. As a matter of course, as the author remarks, we must only assume spontaneous generation

for the simplest creatures of all; all the higher forms must have been gradually produced from these. This first life originated in the "shoreless" sea:—

"Organic life beneath the shoreless waves  
Was born, and nurs'd in ocean's pearly caves;  
First forms minute, unseen by spheric glass,  
Move on the mud, or pierce the watery mass;  
These, as successive generations bloom,  
New powers acquire, and larger limbs assume;  
Whence countless groups of vegetation spring,  
And breathing realms of fin, and feet, and wing."

In the continuation of these verses (lines 295–302) the author recalls to mind that the higher animals, and even "the image of God," commence their course of life as microscopic creatures and points:—

"Imperious man, who rules the bestial crowd,  
Of language, reason, and reflection proud.  
With brow erect who scorns this earthy sod,  
And styles himself the image of his God;  
Arose from rudiments of form and sense,  
An embryo point, or microscopic ens!"

Then, when mountains upheaved by the central fire, or coral reefs, first rose above the surface of the boundless sea, individual living organisms landed upon them, and passing

through an amphibious condition, became aerial creatures. "After islands or continents were raised above the primeval ocean," he says, in a note on p. 29, "great numbers of the most simple animals would attempt to seek food at the edges or shores of the new land, and might thence gradually become amphibious; as is now seen in the frog, who changes from an aquatic animal to an amphibious one; and in the gnat, which changes from a natant to a volant state. . . . Those [organisms] situated on dry land and immersed in dry air, may gradually acquire new powers to preserve their existence; and by innumerable successive reproductions for some thousands, or perhaps millions of ages, may at length have produced many of the vegetable and animal inhabitants which people the earth." As the water-nut (*Trapa natans*) and many other water plants, possess finely divided aquatic leaves, which may be compared with the gills of animals, and also but little divided aerial leaves, comparable to the lungs, so does the frog lose its gills and become instead of a fish-like aquatic animal, an air-breathing quad-

rupted. But even the higher animals in their embryonic development in the egg or the body of the mother point towards this origin from humidity.

“Still Nature’s births enclosed in egg or seed  
From the tall forest to the lowly weed,  
Her beaux and beauties, butterflies and worms,  
Rise from aquatic to aerial forms.  
Thus in the womb the nascent infant laves  
Its natant form in the circumfluent waves;  
With perforated heart unbreathing swims,  
Awakes and stretches all its recent limbs;  
With gills placental seeks the arterial flood,  
And drinks pure ether from its mother’s blood.”

(Canto i. l. 385-394.)

In the first canto the poet sings of the original production of life; the second has the “Reproduction of Life” for its subject. In a note upon this canto a question comes under discussion for the first time in the works of the elder Darwin, which his celebrated grandson first settled experimentally, and one of his great-grandsons (George Darwin) has made the subject of thorough investigation, namely the advantage of cross-fertilization and the mischief of inbreeding.

Dr. Darwin says:—“It may be probably  
“useful occasionally to intermix seeds from

“different situations together; as the anther-  
“dust is liable to pass from one plant to  
“another in its vicinity; and by these means  
“the new seeds or plants may be amended,  
“like the marriages of animals into different  
“families.

“As the sexual progeny of vegetables are  
“thus less liable to hereditary diseases than  
“the solitary progenies, so it is reasonable  
“to conclude, that the sexual progenies of  
“animals may be less liable to hereditary  
“diseases, if the marriages are into different  
“families, than if into the same family; this  
“has long been supposed to be true, by those  
“who breed animals for sale; since if the  
“male and female be of different tempera-  
“ments, as these are extremes of the animal  
“system, they may counteract each other;  
“and certainly where both parents are of  
“families, which are afflicted with the same  
“hereditary disease, it is more likely to  
“descend to their posterity. . . . Finally the  
“art to improve the sexual progeny of either  
“vegetables or animals must consist in  
“choosing the most perfect of both sexes,  
“that is the most beautiful in respect to the

“ body, and the most ingenious in respect to  
 “ the mind; but where one sex is given,  
 “ whether male or female, to improve a progeny  
 “ from that person may consist in choosing a  
 “ partner of a contrary temperament. As  
 “ many families become gradually extinct  
 “ by hereditary diseases, as by scrofula,  
 “ consumption, epilepsy, mania, it is often  
 “ hazardous to marry an heiress, as she is  
 “ not unfrequently the last of a diseased  
 “ family.”\*

His great grandson, George Darwin, has attempted to demonstrate by statistics these suppositions, which indeed have been often expressed, but found that in man no great injury could be ascertained statistically to be produced by family marriages, probably in consequence of the very different conditions under which cousins are frequently brought up.

We now pass over a hundred verses, and see what the author has to say in a note on the Origin of Man. “It has been supposed by “some,” he says, “that mankind were formerly “quadrupeds as well as hermaphrodites; and

\* ‘Temple of Nature,’ Additional Notes, pp. 44, 45.

“ that some parts of the body are not yet so  
 “ convenient to an erect attitude as to a hori-  
 “ zontal one; as the fundus of the bladder  
 “ in an erect posture is not exactly over the  
 “ insertion of the urethra; whence it is sel-  
 “ dom completely evacuated, and thus renders  
 “ mankind more subject to the stone, than if  
 “ he had preserved his horizontality; these  
 “ philosophers, with Buffon and Helvetius,  
 “ seem to imagine that mankind arose from  
 “ one family of monkeys on the banks of the  
 “ Mediterranean; who accidentally had learned  
 “ to use the adductor pollicis, or that strong  
 “ muscle which constitutes the ball of the  
 “ thumb, and draws the point of it to meet  
 “ the points of the fingers; which common  
 “ monkeys do not; and that this muscle gradu-  
 “ ally increased in size, strength, and activity,  
 “ in successive generations; and by this im-  
 “ proved use of the sense of touch, that  
 “ monkeys acquired clear ideas, and gradually  
 “ became men.”\*

The great part performed by the hand and its improved sense of touch is specially described in the third canto, which is devoted

\* ‘Temple of Nature,’ note p. 54.

to the development and progress of the human mind. Animals excel man in being endowed with many kinds of weapons and in having the senses more highly developed, but the influence of the hand in forming the mind more than compensates for all:—

“ Proud man alone in wailing weakness born,  
 No horns protect him, and no plumes adorn;  
 No finer powers of nostril, ear, or eye,  
 Teach the young Reasoner to pursue or fly.—  
 Nerved with fine touch above the bestial throngs,  
 The hand, first gift of Heaven! to man belongs;  
 Untipt with claws the circling fingers close,  
 With rival points the bending thumbs oppose,  
 Trace the nice lines of Form with sense refined,  
 And clear ideas charm the thinking mind.  
 Whence the fine organs of the touch impart  
 Ideal figure, source of every art;  
 Time, motion, number, sunshine or the storm,  
 But mark varieties in Nature's *form*.”

(Canto iii. l. 117-130.)

In young dogs, adds the author, the lips are the principal organs which enable them to acquire an idea of the forms of things; and in young children also the lips play a great part in the same way. He then describes very fully the functions of the impulse of imitation in man, attributing to it

the first origin of all moral actions, languages and arts.

The “*Muse of Mimicry*,” as Darwin, in what follows, repeatedly calls the love of imitation in man, gave rise especially in his opinion to the first language, and the first writing, which was a picture-writing.

On the problem of the origin of language, the learned Lord Monboddo's anonymously published work (“*Of the Origin and Progress of Language*”), in three volumes, had at that time been in existence for a quarter of a century. In this book he shows, by the study of animals and deaf-mutes, in opposition to recent observers, that without speech it is possible to think and to form ideas, for speechless animals manifestly have ideas (vol. i. p. 217 *et seq.*). Signs and musically varied cries formed the commencement (i. p. 476). Articulation was acquired by imitation of natural sounds, e.g. the voices of birds (v. p. 490). Even such new conceptions as that of A. Maurer, that primitive speech was formed not by monosyllabic but polysyllabic words, are already to be found here (i. pp. 507 *et seq.*). It is decidedly much to be wished

that some philologist would analyse this forgotten book from the modern standpoint. We are not sufficiently skilled to examine how much novelty there may be in Dr. Darwin's studies in this department, and must content ourselves with calling attention to the detailed considerations which he gives in his notes, in connection with which we may here reproduce one of the most characteristic passages in the poem :—

“ When strong desires or soft sensations move  
The astonished Intellect to rage or love ;  
Associate tribes of fibrous motions rise,  
Flush the red cheek, or light the laughing eyes.  
Whence ever-active Imitation finds  
The ideal trains, that pass in kindred minds ;  
Her mimic arts associate thoughts excite  
And the first LANGUAGE enters at the sight.”

(Canto iii. l. 335-342.)

After showing how true language has originated from the language of the emotions and gestures, from the first exclamations,

(“ Association's mystic power combines  
Internal passions with external signs.”)

he traces the accentuation and articulation of sounds, the formation of fundamental words and abstract ideas, the growth of

intellect intimately connected with these processes, and the origin of the social virtues or general morality founded upon social intercourse. The fundamental principle of the latter is best expressed in the words of Christ, “ Love thy neighbour as thyself.”

The fourth canto, entitled “ Of Good and Evil,” represents the spiritual as a stage of development of the material world, the sum of the happiness and evil therein. About the first hundred verses are devoted to a description of the pitiless struggle for existence which rages in the air, on the earth, and in the water, making the earth, with its incessantly warring inhabitants, like a vast slaughter-house :—

“ Air, earth, and ocean, to astonish'd day  
One scene of blood, one mighty tomb display !  
From Hunger's arm the shafts of Death are hurl'd,  
And one great Slaughter-house the warring world !”

(Canto iv. l. 63-66.)

This description is no mere passing notion, for in his first didactic poem, ‘ The Botanic Garden,’ written at least twenty years before, this same idea occurs (p. 28). Dr. Balguy had indicated the benefits with which the great Author of all things had favoured

the world. The young animal takes the mother's breast with pleasure, and the mother has pleasure in offering it. The seeds of plants, rich in nutritive material, serve animals for food without themselves feeling pain. Against this much too rose-coloured conception of the world, our author protested at the time. The lion devours the lamb, and the latter the living plants, whilst man *eats* both; there is nothing like peace in nature. In his last work this conception appears to have been much deepened; not only do animals destroy each other and plants, but even the plants struggle among themselves for soil, moisture, air, and light:—

“Yes! smiling Flora drives her armed car  
Through the thick ranks of vegetable war;  
Herb, shrub, and tree with strong emotions rise  
For light and air, and battle in the skies;  
Whose roots diverging with opposing toil  
Contend below for moisture and for soil;  
Round the tall Elm the fluttering Ivies bend,  
And strangle, as they clasp, their struggling friend;  
Envenom'd dews from Mancinella flow,  
And scald with caustic touch the tribes below;  
Dense shadowy leaves on stems aspiring borne  
With blight and mildew thin the realms of corn;  
And insect hordes with restless tooth devour  
The unfolded bud, and pierce the ravell'd flower.”

(Canto iv. l. 41-54.)

Fortunately living creatures often struggle with each other for the advantage of a third party, as when the voracious larvæ of insects which, after their metamorphosis, live only on honey, destroy the innumerable hosts of aphides, which otherwise, from their enormous fertility would exterminate all vegetation. An excess of the caterpillars of butterflies is destroyed by hymenopterous insects; moreover plants are able to protect themselves from complete destruction. Nevertheless this never-resting struggle of all against all, would soon create desolation, if Nature was not so exceedingly fruitful that without such a struggle nearly every creature would very soon overrun the whole world:—

“All these, increasing by successive birth,  
Would each o'erpeople ocean, air, and earth.”

Here is the great question put, What is the meaning for Nature, of this incessant struggle in Nature? For a moment we may perhaps expect to get the solution of this mystery of Nature from the poet who had come so near to it, but it is only a presentiment of the truth, not the truth itself. Thus he says that the

incessant struggle serves to increase the sum of the happiness of the survivors:—

“ Thus the tall mountains, that enclose the lands,  
Huge isles of rock, and continents of sands,  
Whose dim extent eludes the inquiring sight,  
ARE MIGHTY MONUMENTS OF PAST DELIGHT;  
Shout round the globe, how Reproduction strives  
With vanquish'd Death,—and HAPPINESS SURVIVES;  
How life increasing peoples every clime,  
And young renascent Nature conquers Time;  
— And high in golden characters record  
The immense munificence of NATURE'S LORD.”

(Canto iv. l. 447-456.)

By the increased happiness which arises from the death of those which fall in the struggle, the author, however, chiefly understands that fresh life blooms from dull age, and that, as both the number and the size of living animals increase with the decrease of the water, the sum of enjoyment of life must also increase, until the earth is once more reduced to its elements, in order, through chaos, to commence a new cycle.\* The principle of the reconversion of the world into chaos, also supported by modern physics, is laid down by the author in his 'Botanic Garden' with

\* 'Temple of Nature,' p. 166 note.

such force that I cannot refrain from giving this passage as a final example of his poetical power:—

“ — Roll on, ye Stars! exult in youthful prime,  
Mark with bright curves the printless steps of time;  
Near and more near your beamy cars approach,  
And lessening orbs on lessening orbs encroach;  
Flowers of the sky! ye too to age must yield,  
Frail as your silken sisters of the field!  
Star after star from Heaven's high arch shall rush,  
Suns sink on Suns, and systems systems crush,  
Headlong, extinct, to one dark centre fall,  
And Death, and Night, and Chaos mingle all!  
— Till o'er the wreck, emerging from the storm,  
Immortal NATURE lifts her changeful form,  
Mounts from her funeral pyre on wings of flame,  
And soars and shines, another and the same.”

In his 'Phytologia' (xix. 7) the author has treated still more in detail the question of the struggle for existence, and the sum of happiness originating therefrom, and he indicates in the note last cited that the faculty of higher enjoyment increases with the height of organization of the creatures. He had not indeed solved the question, but his remarks upon it have directed the eyes of many of his readers to the struggle for existence, and in this we may perhaps find the explanation of the remarkable fact that so many English

naturalists (Wells, Matthew, Charles Darwin, Wallace, &c.) have one after the other set up the principle of natural selection. This shows the power of the poet to excite the fancy even of others; and a happy fate has arranged that the true heir has obtained the greatest benefit from the bequest.

The 'Temple of Nature' contributed greatly to enhance Darwin's poetical fame, for the representation is more rounded, and less overgrown with allegorical comparisons, than in his first didactic poems. But how little the philosophy expressed in it satisfied the readers of that time may be seen from a criticism which was given of the poem in the 'Edinburgh Review' (vol. ii. 1803, pp. 491-506). In it occurs (p. 501) the following remark, which is interesting in two ways:—"If his fame be destined in anything to outlive the fluctuating fashion of the day, it is on his merit as a poet that it is likely to rest; and his reveries in science have probably no other chance of being saved from oblivion, but by having been 'married to immortal verse.'"

This full recognition of the author's poetical

merits contrasts curiously enough with the sharp judgment of a later critic,\* who, I am afraid, has criticized himself in it. "Nothing in them," he says of the verses, "is done in passion and power; but all by filing, and scraping, and rubbing, and other painstaking. Every line is as elaborately polished and sharpened as a lancet; and the most effective paragraphs have the air of a lot of those bright little instruments arranged in rows, with their blades out, for sale. You feel as if so thick an array of points and edges demanded careful handling, and that your fingers are scarcely safe in coming near them." We see at once that the critic cannot forgive the poet for having been a doctor; regards thought as a mechanical process, and poetry as mechanical work, a higher kind of "pin-making." After the critic has thus shot his arrows, however, he is obliged to admit that in spite of all a true poetical fire lives in these didactic poems and frequently breaks forth. "No writer,"

\* George L. Craik. 'A Compendious History of English Literature, and of the English Language, from the Norman Conquest.' 2nd ed. vol. ii. pp. 382, 383. 8vo. London, 1864.

says he, "has surpassed him in the luminous representation of visible objects in verse; his descriptions have the distinctness of drawings by the pencil, with the advantage of conveying, by their harmonious words, many things that no pencil can paint."

We will be more just, and say, that since the time of Lucretius, hardly any attempt to combine the opposing spheres of science and poetry in a didactic poem, and to put forth therein entire systems, has been so successful as in Darwin's works; but such poems are rather dry in themselves, and will always find fewer admirers than poetical efforts of other kinds. Nevertheless even if the body of these poems should prove to be mortal, an immortal spirit lives in them, and it is this (to turn the words of the Edinburgh Reviewer the other way round) that will keep them above water for all time.

Now, at the conclusion of our analysis, it may be as well to take a general view of the system established by Dr. Erasmus Darwin, in order to arrive at a clear perception of the advance for which the conception of the universe is indebted to him, and of the points

in which he erred. And here we must in the first place admit *that he was the first who proposed and consistently carried out, a well-rounded theory with regard to the development of the living world*, a merit which shines forth most brilliantly when we compare with it the vacillating and confused attempts of Buffon, Linnæus and Göthe. It is the idea of a power working from within the organisms to improve their natural position; and thus, out of the impulses of individual needs, to work towards the perfection of Nature as a whole.

In contrast to the old theory that all adaptation to purpose in the arrangements of the world was fore-calculated and fore-ordained, and that all organisms were merely wheels in a gigantic machine made once for all, and incapable of improvement, this new view is so grand that it deserved a higher appreciation than it has ever met with. The Cartesio-Paleyan comparison of Nature with a great piece of clockwork (a fundamentally mistaken comparison, because every complete mechanical work has only been attained by many gradual improvements in the course of generations), is finally got rid of by it. As regards

the animal world, to which we must ascribe will and active efforts, the idea is so suitable, that Lamarck, who was evidently a disciple of Darwin, has worked it out in all directions, and thus originated a system which is not only still appreciated, but is even now constantly being further elaborated, inasmuch as many naturalists of the present day, as has already been stated, ascribe to birds, for example, the faculty of enhancing the beauty of their plumage by wishes and efforts, and so forth. This is true Darwinism of the last century—Darwinism of the old school.

X This Darwinism has been criticized by no one so well as by its author himself, when he applied it with strict logic to the development of plants. To be able to do this he was obliged to attribute mental functions to plants, and to endow them with the faculty of striving for a purpose. Even in the 'Botanic Garden' he therefore declared the necessity of admitting that plants possess the sense of heat and cold, of moisture and dryness, of light and darkness, a sense of touch, and amatory desires, besides the power of the roots to select suitable nourishment. For

these reasons he also specially occupied himself with the study of the so-called sensitive plants, and of insect-capturing plants, the most remarkable of which (*Mimosa*, *Hedysarum gyrans*, *Dioncæa muscipula*, *Apocynum androsæmifolium*) he had figured on fine quarto plates to illustrate the 'Botanic Garden.'

In the 'Zoonomia' he repeated these views; and in the first part of the 'Phytologia,' which treats of the physiology of plants, he is much occupied with the search for vegetable organs representing the organs of sense, nerves, and ganglia, of animals. Nay, he even thought that an organ analogous to the central nervous apparatus of animals, a vegetable brain, could not be wanting; and as he rightly compared the composite vegetable body to a coral-stock, he was obliged to ascribe such an organ to each individual bud. For as he ascribed to them (and according to his theory was compelled to ascribe to them), besides the power of nourishing and propagating themselves, also that of endeavouring to improve their position in life in accordance with external conditions, he logically concluded

that he must for this purpose postulate an organ of self-help, a sensorium.

In order to penetrate more clearly into the course of his ideas upon this point, I may be allowed to quote, in part, a passage from the 'Phytologia' (Sect. xiv. 3, 2), and the rather because it at the same time fills a gap purposely left in the exposition of his philosophical system.

"There appears," he says, "to be a power  
 "impressed on organized bodies by the great  
 "author of all things by which they not only  
 "increase in size and strength from their  
 "embryon state to their maturity, and oc-  
 "casionally cure their accidental diseases, and  
 "repair their accidental injuries, but also a  
 "power of producing armour to prevent those  
 "more violent injuries, which would other-  
 "wise destroy them. Of this last kind are  
 "the poisonous juices of some plants, as of  
 "*atropa belladonna*, deadly nightshade, *hy-*  
 "*oscyamus*, hen-bane, *cynoglossum*, hound's  
 "tongue . . . . . Some vegetables have  
 "acquired an armour, which lessens, though  
 "it does not totally prevent, the injuries of  
 "this animal [the aphis]. This is most con-

"spicuous on the stems and floral leaves of  
 "moss-roses, and on the young shoots and  
 "leaf-stalks of nut trees. Both these are  
 "covered with thickset bristles, which termi-  
 "nate in globular heads, and not only prevent  
 "the aphis from surrounding them in such  
 "great numbers, and from piercing their  
 "vessels so easily, but also secrete from the  
 "gland, with which I suspect them to be  
 "terminated, a juice, which is inconvenient or  
 "deleterious to the insect which touches it.\*  
 ". . . . The essential oils are all deleterious to  
 "certain insects, and hence their use in the  
 "vegetable economy, being produced in  
 "flowers or leaves to protect them from the  
 "depredations of their voracious enemies."

I do not think I am deceiving myself in saying that this merely logical extension of his theory to the vegetable kingdom has robbed it of the efficacy which it might have attained if limited to the animal kingdom. The small amount of interest excited by the attempts, both of the elder Darwin and of

\* Corresponding observations upon glandular hairs which, by their sticky exudations, protect young shoots of plants from the attacks of insects, have lately been made by Mr. Francis Darwin and by Dr. Fritz Müller. See 'Kosmos,' Bd. i. p. 354.

Lamareck, at the solution of the world-enigma, shows us that they were not adapted to satisfy men's minds. They explain the adaptation to purpose of organisms by an obscure impulse or sense of what is purpose-like; and yet even with regard to man we are in the habit of saying, that one can never know what so and so is good for. *The purpose-like is that which approves itself*, and not always that which is struggled for by obscure impulses and desires. Just in the same way *the beautiful is what pleases*.

Erasmus Darwin's system was in itself a most significant first step in the path of knowledge which his grandson has opened up for us, but to wish to revive it at the present day, as has actually been seriously attempted, shows a weakness of thought and a mental anachronism which no one can envy.
